i. Preface

This document specifies a GML coverage structure extending the definition of GML 3.2.1 [07-036] in a compatible way.

The main change extending GML is the addition of one mandatory component, rangeType, to the Coverage definition of GML 3.2.1 to provide a concise description of the coverage range value definition.

This enhanced coverage type is used, for example, by the Web Coverage Service (WCS) Standard [1] version 2.0 and higher, but is independent from WCS service. This augmented coverage structure can serve a wide range of coverage application domains and service types, thereby contributing to harmonization and interoperability.

ii. Terms and definitions

This document uses the specification terms defined in Subclause 5.3 of [OGC 06-121r9], which is based on the ISO/IEC Directives, Part 2, Rules for the structure and drafting of International Standards. In particular, the word “shall” (not “must”) is the verb form used to indicate a requirement to be strictly followed to conform to this standard.

iii. Submitting organizations

The following organizations have submitted this Implementation Specification to the Open Geospatial Consortium, Inc.:

- Jacobs University Bremen
- National Center for Atmospheric Research (NCAR)
- Oracle USA
- PCI Geomatics Inc.
- ERDAS, Inc.
- EOX IT Services GmbH
- Spot Image
- BAE Systems - C3I Systems
- Natural Environment Research Council (NERC)
- George Mason University

vi. Changes to the OpenGIS® Abstract Specification

The OpenGIS® Abstract Specification does not require any changes to accommodate the technical contents of this (part of this) document.

vii. Future Work

In collaboration with the GML Standard Working Group it is foreseen to rationalize between Application Schema and the coverage schema in GML 4.0.
Foreword

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The Open Geospatial Consortium Inc. shall not be held responsible for identifying any or all such patent rights.

Recipients of this document are requested to submit, with their comments, notification of any relevant patent claims or other intellectual property rights of which they may be aware that might be infringed by any implementation of the standard set forth in this document, and to provide supporting documentation.
Introduction

Coverages represent digital geospatial information representing space/time-varying phenomena. OGC Abstract Topic 6 [OGC 07-011] – which is identical to ISO 19123 – defines an abstract model of coverages. Coverage instances may be encoded using the Geography Markup Language (GML) 3.2 [07-036], an XML grammar written in XML Schema for the description of application schemas as well as the transport and storage of geographic information.

However, the definition contained in GML 3.2.1 has turned out to not contain sufficient information to describe coverage instances in a flexible, interoperable, and harmonized manner. To remedy this, this document defines a GML Application Schema for coverages by applying the following enhancements to the GML 3.2.1 Coverage data type:

- A mandatory element rangeType has been added to carry information about the range value data structure of a Coverage.

- The property coverageFunction, which in GML 3.2.1 [OGC 07-036] is associated with every subtype of Coverage, is moved up into AbstractCoverage in the coverage type hierarchy of the standard on hand. This semantic-preserving modification does not impact instance documents.

- A metadata hook has been added which allows definition of application specific supplementary information to be transported with a coverage.

- The grid coverage types are subtypes of AbstractCoverage rather than being subtypes of DiscreteCoverage as in GML 3.2.1 [OGC 07-036].

This is a strict extension: no existing part of the GML 3.2.1 [OGC 07-036] Coverage is changed in its syntax, nor in its semantics.
OGC® GML Application Schema - Coverages

1 Scope

This document specifies the GML coverage structure to be used by OGC standards.

2 Conformance

Standardisation target of this document are concrete coverage instance documents, as generated by some service and/or consumed by some client.

This document establishes a single requirements class, gml-coverage, of URI http://www.opengis.net/spec/GMLCOV/1.0/req/gml-coverage with a single pertaining conformance class, gml-coverage, of URI http://www.opengis.net/spec/GMLCOV/1.0/conf/gml-coverage. Requirements and conformance test URIs defined in this document are relative to http://www.opengis.net/spec/GMLCOV/1.0/.

Annex A lists the conformance tests which shall be exercised on any software artefact claiming to implement this Application Schema.

3 Normative references

This OGC GML Application Schema for Coverages standard consists of the requirements defined in this document and an XML Schema including Schematron constraints. The complete specification is identified by OGC URI http://www.opengis.net/spec/GMLCOV/1.0, the document has OGC URI http://www.opengis.net/doc/AppSchema/GMLCOV/1.0.

The complete standard is available for download from http://www.opengeospatial.net/standards/gmlcov. Additionally, the XML Schema is posted online at http://schemas.opengis.net/gmlcov/1.0 as part of the OGC schema repository. In the event of a discrepancy between bundled and schema repository versions of the XML Schema files, the schema repository shall be considered the normative reference.

The following normative documents contain provisions (conformance classes) that, through reference in this text, constitute provisions of this specification. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. For undated references, the latest edition of the normative document referred to applies.

Conformance classes used:

- Simple coverage interface
- Discrete coverage interface
- Thiessen polygon coverage interface
- Quadrilateral grid coverage interface
OGC 09-146r1

- Hexagonal grid coverage interface
- TIN coverage interface
- Segmented curve coverage interface
- Discrete coverage interchange
- Thiessen polygon coverage interchange
- Quadrilateral grid coverage interchange
- Hexagonal grid coverage interchange
- TIN coverage interchange
- Segmented curve coverage interchange

OGC 07-036, *Geography Markup Language (GML) Encoding Standard*, version 3.2.1
Conformance classes used:
- GML application schemas defining coverages
- GML documents

OGC 08-094, *OGC® SWE Common Data Model Encoding Standard*, version 2.0
Conformance classes used:
- Core
- UML models
- XML Schema

4 Terms and definitions

For the purposes of this document, the terms and definitions given in the above references apply. In addition, the following terms and definitions apply.

4.1 coverage

feature that acts as a function to return values from its range for any direct position within its spatiotemporal domain [OGC 07-011]

4.2 GML coverage

feature which is a subclass (specialization) of a Coverage as defined in the GML Application Schema for Coverages [OGC 09-146r1]

5 Conventions

5.1 Use of term “coverage”

The definition of “coverage” in Subclause 4.1 is the generic one provided by Abstract Topic 6 [OGC 07-011]. The term “GML coverage” is coined to denote the concrete data structure defined in the document on hand, relying on GML 3.2.1 [OGC 07-036] and SWE Common 2.0 [OGC 08-094].

For the remainder of this document, “coverage” shall be understood as a shorthand for “GML coverage” unless explicitly stated otherwise.

Copyright © 2010 Open Geospatial Consortium
5.2 UML notation

All the diagrams that appear in this specification are presented using the Unified Modeling Language (UML) static structure diagram, as described in Subclause 5.2 of OGC Web Service Common [OGC 06-121r9]. Further, the following conventions hold:

- UML elements having a package name of GML are those defined in the UML model of GML 3.2.1 [OGC 07-036].
- UML elements having a package name of “SWE Common” are those defined in the UML model of SWE Common 2.0 [OGC 08-094].
- UML elements not qualified with a package name are those defined in this Application Schema.

5.3 Namespace prefix conventions

The namespace prefixes used in this document are not normative and are merely chosen for convenience; they may appear in examples without being formally declared, and have no semantic significance. The namespaces to which the prefixes correspond are normative, however.

6 Coverage Model

This Clause specifies the changes over the GML 3.2.1 coverage model and the components adopted from the SWE Common data model.

6.1 Overview

In GML 3.2.1, all coverage types are derived from the abstract Coverage data type. This structure contains a domainSet describing the coverage’s domain and a rangeSet component containing the range values (“pixels”, “voxels”) of the coverage. This Application Schema extends GML 3.2.1 [OGC 07-036] class Coverage with two components, rangeType and metadata.

- The rangeType element describes the coverage's range set data structure. A range value often consists of one or more fields (in remote sensing also referred to as bands or channels), however, much more general definitions are possible. Range value structure description is based on the SWE Common [OGC 08-094] DataRecord.
The abstract coverage definition is augmented with an extensible slot for metadata. The intended use is to define concrete metadata structures and their semantics in extensions or application profiles.

The following changes apply over the GML 3.2.1 [OGC 07-036] specification:

- The property `coverageFunction`, which in GML 3.2.1 [OGC 07-036] is associated with every subtype of `Coverage`, is moved up into `Coverage` in the coverage type hierarchy of the standard on hand.

  NOTE This way, the coverage function is available in any subtype of `Coverage`. This serves to prepare for continuous coverages, like in the case described next.

- The grid coverage types are subtypes of `Coverage` rather than being subtypes of `DiscreteCoverage` as in GML 3.2.1 [OGC 07-036].

  NOTE This allows representing not only discrete grid coverages, but also continuous coverages by using grids for the reference points in conjunction with a coverage function defining interpolation.

No further changes over GML 3.2.1 [OGC 07-036] are made in this document. In particular, no pre-existing component changes its semantics.
For the standard on hand, Coverage shall always refer to the definition of this Application Schema and not to the GML definition of the same name, unless explicitly stated otherwise.

Figure 1 shows the UML diagram pertaining to this Application Schema.

**Requirement 1 /req/gml-coverage/structural-adherence:**
Any XML document instantiating a concrete subtype of Coverage shall conform with the UML diagram in Figure 1, with Table 2, and with the XML schema defined as part of this standard.

### Table 2 The Coverage data structure

<table>
<thead>

<td>One (mandatory)</td>
</tr>
<tr>
<td>rangeSet</td>
<td>GML 3.2.1 Coverage range values</td>
<td>GML::RangeSet</td>
<td>One (mandatory)</td>
</tr>
</tbody>
</table>

**NOTE 1** The optional element gml:Envelope serves to establish a bounding box of the coverage on hand. For a purely spatial coverage, gml:Envelope is appropriate. In case the coverage also has a spatial axis, gml:Envelope can be substituted by a gml:EnvelopeWithTimePeriod; in case of a purely temporal coverage, spatial dimension in gml:EnvelopeWithTimePeriod will be zero.

**NOTE 2** UML data type Any is used here with the same meaning as XML’s xsd:any, which does not have a direct equivalent in UML.

**NOTE 3** Following the GML pattern described in [OGC 07-036], on GML level SWE::DataRecord is linked to rangeType via an association SWE::DataRecordPropertyType.

### 6.2 CoverageFunction

The coverageFunction component is identical in its syntax and meaning to the coverage-Function element defined in GML [OGC 07-036] Subclause 19.3.11.

### 6.3 Metadata

The metaData component is a carrier for any kind of application dependent metadata. Hence, no requirements are imposed here.
6.4 RangeType

The `rangeType` component adds a structure description and technical metadata required for an appropriate (however, application independent) understanding of a coverage. For this structure description, the SWE Common `DataRecord` is used.

**Requirement 2 /req/gml-coverage/dataRecord:**
The range type component of a coverage shall conform with the `DataRecord` of SWE Common [OGC 08-094].

**Dependency:** [OGC 08-094] Clause 7 ([http://www.opengis.net/doc/SWE/2.0/clause/7](http://www.opengis.net/doc/SWE/2.0/clause/7)), [OGC 08-094] Clause 8 ([http://www.opengis.net/doc/SWE/2.0/clause/8](http://www.opengis.net/doc/SWE/2.0/clause/8)).

NOTE Following GML patterns the `swe:DataRecord` is linked into `gmlwcs:AbstractCoverageType` via `swe:DataRecordPropertyType`.

Atomic data types available for range values are those given by the SWE Common data type `AbstractSimpleComponent`. As a range structure contains only structure definitions, but not the values themselves (these sit in the coverage range set component), the optional `AbstractSimpleComponent` component value is suppressed in coverages.

**Requirement 3 /req/gml-coverage/no-value-in-rangeType:**
For all SWE Common `AbstractSimpleComponent` subtypes in a range type structure, instance multiplicity of the value component shall be zero.

NOTE Following [OGC 08-094], omission of the value component implies that in a `DataArray` there is no encoding component either.

Range values can be structured as records or arrays. Both structuring principles can be nested (and mixed) to any depth for a concrete coverage range structure definition.

**Requirement 4 /req/gml-coverage/record-or-dataArray:**
Wherever the SWE Common XML schema allows an `AbstractDataComponent` in a coverage range structure the concrete instance shall be one of the `AbstractDataComponent` subtypes `DataRecord` and `DataArray`.

NOTE In particular, these `AbstractDataComponent` subtypes are not allowed in range structures: `DataChoice`, `Vector`, `Matrix`.

Within a `DataRecord` contained in a concrete range structure, each of its record components is locally uniquely identified by the record component’s `field` attribute, in accordance with the “soft-typing” property introduced by SWE Common.

Example The following XML fragment represents a valid range structure; it models the red, green, and blue channel of a Landsat scene. Pixels are defined as unsigned 8-bit quantities where 0 and 255 denote null values:

```xml
<rangeType>
  <swe:field name="red">
    <swe:Quantity definition="http://opengis.net/def/property/OGC/0/Radiance">
      <gml:description>Red Channel</gml:description>
      <gml:name>Red</gml:name>
      <swe:nilValues>
        <swe:NilValues gml:id="NIL_VALUES">
          <swe:nilValue reason="http://www.opengis.net/def/nil/OGC/0/BelowDetectionRange">
```

Copyright © 2010 Open Geospatial Consortium
6.5 RangeSet coherence

Both domainSet and rangeType describe the coverage values given in the rangeSet. Hence, consistency must be enforced between them. The pertaining requirements are listed in this Subclause.

Requirement 5 /req/gml-coverage/one-range-value-per-position:
For each coordinate position contained in the domain set description of a coverage there shall exist exactly one range value in the coverage’s range set.

NOTE Both duplicates and values omitted are not allowed. For range values not known for some reason nil values can be used.

Requirement 6 /req/gml-coverage/range-structure-consistency:
All range values contained in the range set of a coverage shall be consistent with the structure description provided in its range type.
6.6 Specific coverage types

This standard supports all coverage types which GML 3.2.1 [OGC 07-036] supports, which implement the discrete coverage types defined in ISO 19123 (listed in parenthesis). The supported types are substitutable from Coverage and include:

- MultiPointCoverage (ISO 19123: CV_DiscretePointCoverage)
- MultiCurveCoverage (ISO 19123: CV_DiscreteCurveCoverage)
- MultiSurfaceCoverage (ISO 19123: CV_DiscreteSurfaceCoverage)
- MultiSolidCoverage (ISO 19123: CV_DiscreteSolidCoverage)
- GridCoverage (ISO 19123: CV_DiscreteGridPointCoverage)
- RectifiedGridCoverage (ISO 19123: CV_DiscreteGridPointCoverage)
- ReferenceableGridCoverage (added to GML via Change Request [OGC 07-112r3])

The above coverage types may be used as is, or new coverage types may be constructed by using or deriving from one of the subtypes of Coverage or one of its subtypes.

**Requirement 7 /req/gml-coverage/coverage-derivation:**
The type of the root element of a coverage document instance **shall** be a concrete direct or indirect subtype of Coverage.

Figure 2 shows the UML diagram of the coverage hierarchy.

**NOTE** As in GML, continuous coverages are not currently supported. Consequently, ContinuousCoverage does not have any concrete subtype.

6.6.1 DiscreteCoverage

The domain set of a discrete coverage consists of either spatial or temporal geometry objects, finite in number. The range set is comprised of a finite number of attribute values each of which is associated to every direct position within any single spatiotemporal object in the domain. In other words, the range values are constant on each spatiotemporal object in the domain. This coverage function maps each element from the coverage domain to an element in its range.

This class serves as the head of a specialization hierarchy which contains MultiPointCoverage, MultiCurveCoverage, MultiSurfaceCoverage, and MultiSolidCoverage.

**NOTE** In GML 3.2.1 [OGC 07-036] grid coverages are contained in this class hierarchy as well based on a distinction between discrete and continuous coverages which is not considered state of the art any more. This Application Schema changes the hierarchy in that coverages are put separately, allowing to model continuous grid coverages.
6.6.2 ContinuousCoverage

A continuous coverage as defined in ISO 19123 is a coverage that can return different values for the same feature attribute at different direct positions within a single spatiotemporal object in its spatiotemporal domain. The base type for continuous coverages is ContinuousCoverage.

Abstract class ContinuousCoverage serves as the head of a substitution group which may contain any continuous coverage whose type is derived from ContinuousCoverage. It parallels GML::ContinuousCoverage, except that the coverageFunction element has been moved "up" into Coverage.

NOTE This GML handling of continuous coverages is under reconsideration, therefore use of ContinuousCoverage is not encouraged. The various grid coverage types (see Subclause 6.6.7ff) allow already modelling certain types of continuous coverages.

6.6.3 MultiPointCoverage

In a MultiPointCoverage the domain set is a GM_MultiPoint, that is a collection of arbitrarily distributed geometric points.

Requirement 8 /req/gml-coverage/multiPointCoverage:
A coverage of type MultiPointCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiPoint values.
In the GML representation of a MultiPointCoverage the mapping from the domain to the range is straightforward:

- For gml:DataBlock encodings the points of the gmlcov:MultiPoint are mapped in document order to the tuples of the data block.

- For gml:CompositeValue encodings the points of the gmlcov:MultiPoint are mapped to the members of the composite value in document order.

- For gml:File encodings the points of the gmlcov:MultiPoint are mapped to the records of the file in sequential order.

### 6.6.4 MultiCurveCoverage

In a MultiCurveCoverage the domain is partitioned into a collection of curves comprising a GM_MultiCurve. The coverage function then maps each curve in the collection to a value in the range set.

**Requirement 9 [req/gml-coverage/multiCurveCoverage]**: A coverage of type MultiCurveCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have “GML 3.2”: :MultiCurve values.

In the GML representation of a MultiCurveCoverage the mapping from the domain to the range is straightforward:

- For gml:DataBlock encodings the curves of the gmlcov:MultiCurve are mapped in document order to the tuples of the data block.

- For gml:CompositeValue encodings the curves of the gmlcov:MultiCurve are mapped to the members of the composite value in document order.

- For gml:File encodings the curves of the gmlcov:MultiCurve are mapped to the records of the file in sequential order.

### 6.6.5 MultiSurfaceCoverage

In a MultiSurfaceCoverage the domain is partitioned into a collection of surfaces comprising a GM_MultiSurface. The coverage function maps each surface in the collection to a value in the range set.

**Requirement 10 [req/gml-coverage/multiSurfaceCoverage]**: A coverage of type MultiSurfaceCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiSurface values.

In the GML representation of a MultiSurfaceCoverage the mapping from the domain to the range is straightforward:

- For gml:DataBlock encodings the surfaces of the gmlcov:MultiSurface are mapped in document order to the tuples of the data block.
For gml:CompositeValue encodings the surfaces of the gmlcov:MultiSurface are mapped to the members of the composite value in document order.

For gml:File encodings the surfaces of the gmlcov:MultiSurface are mapped to the records of the file in sequential order.

6.6.6 MultiSolidCoverage

In a MultiSolidCoverage the domain is partitioned into a collection of solids comprising a GM_MultiSolid. The coverage function then maps each solid in the collection to a value in the range set.

Requirement 11/req/gml-coverage/multiSolidCoverage:
A coverage of type MultiSolidCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiSolid values.

In the GML representation of a MultiSolidCoverage the mapping from the domain to the range is straightforward:

- For gml:DataBlock encodings the solids of the gmlcov:MultiSolid are mapped in document order to the tuples of the data block.
- For gml:CompositeValue encodings the solids of the gmlcov:MultiSolid are mapped to the members of the composite value in document order.
- For gml:File encodings the solids of the gmlcov:MultiSolid are mapped to the records of the file in sequential order.

6.6.7 GridCoverage

A GridCoverage is a discrete point coverage in which the domain is a geometric grid of points encoded using gml:Grid (not its subtypes gml:RectifiedGrid or a subtype of AbstractReferenceableGrid). Note that this is similar to the MultiPointCoverage except that a gml:Grid shall be used to describe the domain.

Requirement 12/req/gml-coverage/gridCoverage:
A coverage of type GridCoverage shall have a domain that is a GML::Grid.

NOTE Such geometric positioning is introduced in the RectifiedGridCoverage.

In order to address ambiguities in the gml:Grid definition, this GML Application Schema for Coverages imposes additional constraints on the use of a gml:Grid within a gmlcov: GridCoverage. (Specifically, there is no provision in the definition of gml:Grid definition to express the relationship between the grid positions and this geometry's coordinate reference system, which will always exist in some contexts, such as a Web Coverage Service. This coordinate reference system will be explicitly referenced in the srsName attribute of the gml: SRSReferenceGroup of gml:Grid, or be inherited from an enclosing container element, such as the gml:Envelope of this gmlcov:GridCoverage.) Since provision for expressing a relationship does not exist, whenever used in gmlcov:GridCoverage, the relationship shall be simple. In this simple relationship, the dimension attribute of the gml:Grid shall be identical to the dimension of the geometry's
coordinate system, the axes of the gml:Grid shall be identical to the axes of the geometry's coordinate system (which requires that the axisLabels be identical to those in the coordinate system definition), and the limits shall be treated as being expressed as coordinates in the geometry's coordinate reference system.

Clearly these additional constraints are quite limiting, in that gridded datasets whose Reference points happen to exist exactly at integral coordinates of a spatial coordinate system at a spacing of exactly one in all coordinate dimensions are exceedingly rare, unless that coordinate system is part of a gml:ImageCRS. Nevertheless, the gmlcov:GridCoverage is available for such purposes.

It is recommended that the more sensible provisions of the gmlcov:RectifiedGridCoverage or gmlcov:ReferenceableGridCoverage be utilized for all gridded datasets, since their domains can accommodate the simple provisions of the gmlcov:GridCoverage as well as more complex referencing situations.

Since this GridCoverage uses Coverage, it can be used for both discrete and continuous coverages.

### 6.6.8 RectifiedGridCoverage

A RectifiedGridCoverage is a discrete point coverage based on a rectified grid. It is similar to the grid coverage except that the points of the grid are geometrically referenced.

**Requirement 13 /req/gml-coverage/rectifiedGridCoverage:**
A coverage of type RectifiedGridCoverage shall have a domain that is a GML::RectifiedGrid geometry.

Since this RectifiedGridCoverage uses Coverage, it can be used for both discrete and continuous coverages.

### 6.6.9 ReferenceableGridCoverage

A ReferenceableGridCoverage is an implementation of ISO 19123 DiscreteGridPointCoverage for a ReferenceableGrid domain.

**Requirement 14 /req/gml-coverage/referenceableGridCoverage:**
A coverage of type ReferenceableGridCoverage shall have a domain geometry that is a subtype of GML::ReferenceableGrid.

Since this ReferenceableGridCoverage uses the gmlcov:AbstractCoverageType, it can be used for both discrete and continuous coverages.

**NOTE** The equivalent of this element has been added to GML 3.2.1 by approved Change Request 07-112r3 and, therefore, has been added to this standard as well.

### 6.7 Complete coverage example

Example The following is a complete RectifiedGridCoverage instance:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<gmlcov:RectifiedGridCoverage
```

Annex A
(normative)

Abstract test suite

This Annex specifies an Abstract Test Suite which shall be passed in completeness by any implementation claiming conformance with this Application Schema.

A.1 Conformance Test Class: gml-coverage

The OGC URI identifier of this conformance class is: http://www.opengis.net/spec/GMLCOV/1.0/conf/gml-coverage. Tests identifiers below are relative to http://www.opengis.net/spec/GMLCOV/1.0/.

A.1.1 Document validates

Test id: /conf/gml-coverage/structural-adherence

Test Purpose: Requirement /req/gml-coverage/structural-adherence:
Any XML document instantiating a concrete subtype of Coverage shall conform with the UML diagram in Figure 1, with Table 2, and with the XML schema defined as part of this standard.

Test method: Load document into an XML validator. Test passes if coverage instance document is a valid concrete subtype of gmlcov:AbstractCoverage-Type.

A.1.2 DataRecord range structure

Test id: /conf/gml-coverage/dataRecord

Test Purpose: Requirement /req/gml-coverage/dataRecord:
The range type component of a coverage shall conform with the Data-Record of SWE Common [OGC 08-094].

Test method: Validate XML structure of given coverage instance against SWE Common by evaluating its conformance test suite. Test passes if all applicable SWE Common tests pass.

A.1.3 No value component in rangeType

Test id: /conf/gml-coverage/no-value-in-rangeType

Test Purpose: Requirement /req/gml-coverage/no-value-in-rangeType:
For all SWE Common AbstractSimpleComponent subtypes in a range type structure, instance multiplicity of the value component shall be zero.
**Test method:** Inspect `swe:DataRecord` element in the given instance document and check that no value component is present.

One way of doing so is to evaluate this Schematron rule:

```xml
    <sch:assert test="count(//swe:value)=0"/>
</sch:rule>
```

Test passes if constraint holds.

### A.1.4 Admissible DataRecord subtypes

**Test id:** `/conf/gml-coverage/record-or-dataArray`

**Test Purpose:** Requirement `/req/gml-coverage/record-or-dataArray`: Wherever the SWE Common XML schema allows an AbstractDataComponent in a coverage range structure the concrete instance shall be one of the AbstractDataComponent subtypes DataRecord and DataArray.

**Test method:** Inspect the given instance document and check the above constraint. One way of doing so is to evaluate this Schematron rule:

```xml
<sch:rule>
    <sch:assert test="descendant-or-self::*[name()='swe:DataRecord' or name()='swe:DataArray']"
                />
</sch:rule>
```

Test passes if constraint holds.

### A.1.5 Exactly one range value

**Test id:** `/conf/gml-coverage/one-range-value-per-position`

**Test Purpose:** Requirement Both domainSet and rangeType describe the coverage values given in the rangeSet. Hence, consistency must be enforced between them. The pertaining requirements are listed in this Subclause.

/req/gml-coverage/one-range-value-per-position:
For each coordinate position contained in the domain set description of a coverage there shall exist exactly one range value in the coverage’s range set.
OGC 09-146r1

**Test method:** Inspect the given instance document and check, for each possible cell location as defined in the coverage’s domain set, that there is exactly one corresponding value in the range set.

### A.1.6 Range values adhere to range structure definition

**Test id:** /conf/gml-coverage/range-structure-consistency

**Test Purpose:** Requirement /req/gml-coverage/range-structure-consistency:
All range values contained in the range set of a coverage shall be consistent with the structure description provided in its range type.

**Test method:** Inspect the given instance document and check, for each range value tuple:

- Number of tuple components adheres to range structure definition.
- Data type of each atomic value conforms to the corresponding data type specification in the range structure definition.

Test passes if constraints evaluate to true.

### A.1.7 Coverage type correctly derived

**Test id:** /conf/gml-coverage/coverage-derivation

**Test Purpose:** Requirement /req/gml-coverage/coverage-derivation:
The type of the root element of a coverage document instance shall be a concrete direct or indirect subtype of `Coverage`.

**Test method:** Check whether the XML type of the root element of the given instance document

- Is not abstract
- Is a direct or indirect subtype of `gmlcov:AbstractCoverage`.

Test passes if constraints evaluate to true.

### A.1.8 Correct structure of multi-point coverage

**Test id:** /conf/gml-coverage/multiPointCoverage
Test Purpose: Requirement /req/gml-coverage/multiPointCoverage:
A coverage of type MultiPointCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiPoint.

Test method: Check the XML type of the root element of the given instance document.

- If type is MultiPointCoverage: check whether the document’s domainSet element contains values of type gml:MultiPoint.
- otherwise: pass test.

Test passes if constraints evaluate to true.

A.1.9 Correct structure of multi-curve coverage

Test id: /conf/gml-coverage/multiCurveCoverage

Test Purpose: Requirement /req/gml-coverage/multiCurveCoverage:
A coverage of type MultiCurveCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have “GML 3.2”:MultiCurve values.

Test method: Check the XML type of the root element of the given instance document.

- If type is MultiCurveCoverage: check whether the document’s domainSet element contains values of type gml:MultiCurve.
- otherwise: pass test.

Test passes if constraints evaluate to true.

A.1.10 Correct structure of multi-surface coverage

Test id: /conf/gml-coverage/multiSurfaceCoverage

Test Purpose: Requirement /req/gml-coverage/multiSurfaceCoverage:
A coverage of type MultiSurfaceCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiSurface values.

Test method: Check the XML type of the root element of the given instance document.

- If type is MultiSurfaceCoverage: check whether the document’s domainSet element contains values of type gml:MultiSurface.

Copyright © 2010 Open Geospatial Consortium
• otherwise: pass test.

Test passes if constraints evaluate to true.

A.1.11 Correct structure of multi-solid coverage

Test id: /conf/gml-coverage/multiSolidCoverage

Test Purpose: Requirement /req/gml-coverage/multiSolidCoverage:
A coverage of type MultiSolidCoverage shall have a content model identical with DiscreteCoverage, except that the domainSet shall have GML::MultiSolid values.

Test method: Check the XML type of the root element of the given instance document.

• If type is MultiSolidCoverage: check whether the document’s domainSet element contains values of type gml:MultiSolid.

• otherwise: pass test.

Test passes if constraints evaluate to true.

A.1.12 Correct structure of grid coverage

Test id: /conf/gml-coverage/gridCoverage

Test Purpose: Requirement A GridCoverage is a discrete point coverage in which the domain is a geometric grid of points encoded using gml:Grid (not its subtypes gml:RectifiedGrid or a subtype of AbstractReferenceableGrid). Note that this is similar to the MultiPointCoverage except that a gml:Grid shall be used to describe the domain.

/req/gml-coverage/gridCoverage:
A coverage of type GridCoverage shall have a domain that is a GML::Grid.

Test method: Check the XML type of the root element of the given instance document.

• If type is GridCoverage: check whether the document’s domainSet element is a gml:Grid.

• otherwise: pass test.

Test passes if constraints evaluate to true.
A.1.13 Correct structure of rectified grid coverage

Test id: /conf/gml-coverage/rectifiedGridCoverage

Test Purpose: Requirement /req/gml-coverage/rectifiedGridCoverage:
A coverage of type RectifiedGridCoverage shall have a domain that is a GML::RectifiedGrid geometry.

Test method: Check the XML type of the root element of the given instance document.

- If type is RectifiedGridCoverage: check whether the document’s domainSet element is a gml:RectifiedGrid.
- otherwise: pass test.

Test passes if constraints evaluate to true.

A.1.14 Correct structure of referenceable grid coverage

Test id: /conf/gml-coverage/referenceableGridCoverage

Test Purpose: Requirement /req/gml-coverage/referenceableGridCoverage:
A coverage of type ReferenceableGridCoverage shall have a domain geometry that is a subtype of GML::ReferenceableGrid.

Test method: Check the XML type of the root element of the given instance document.

- If type is ReferenceableGridCoverage: check whether the document’s domainSet element is in the substitution group of gml:AbstractReferenceableGrid.
- otherwise: pass test.

Test passes if constraints evaluate to true.
