i. Preface

This expanded OGC™ Recommendation Paper specifies XML encoding of data defining image coordinate reference systems and coordinate operations. The previous version was limited to CRSs for individual (monoscopic) unrectified images. This extension also covers georectified images. This paper might be expanded in the future to also cover stereoscopic images.

This expanded paper adapts more the parts of [OGC 05-014], titled Image CRSs for IH4DS.

Many key contents of this paper are provided in the attached set of files, in the same zip file. These files include the:

- a) Example XML documents included and XML Schemas referenced in Clause 6 “Unrectified image coordinate reference systems”, Clause 7 “Georectified image coordinate reference systems”, and Clause 8 “Coordinate transformations”
- b) Standard definitions encoded in XML in Clause 9 “Standard URNs and XML definitions”
- c) Example Application Schemas and XML documents in Annex A "Application schema examples".

The changes made in this document version, relative to the previous version, are tracked by Microsoft Word, and can be viewed if desired. If you choose to submit suggested changes by editing this document, please first accept all the current changes, and then make your suggested changes with change tracking on.

ii. Document contributor contact points

All questions regarding this document should be directed to the editor or the contributors:

2005-03-08	1.0.1	Arliss Whiteside	7, 8	Added new Clauses 7 and 8
2005-04-14	1.1.0	Arliss Whiteside	Cover, i, 7.2, 8.3	Edited as approved Recommendation Paper

iv. Changes to the OGC Abstract Specification

The OGC™ Abstract Specification does not require changes to accommodate the technical contents of this document.

v. Future work

Improvements of this document are needed to:

- a) Modify XML schemas to reflect recent changes in the Topic 2 UML model [OGC 04-046r3]
- b) Specify standard XML encodings of some well-known operation methods, coordinate operations, CRSs, units, etc., and specify URNs to reference them

Foreword

This OGC™ Recommendation Paper expands and supersedes previous OGC Recommendation Paper numbered 05-012, also titled "Recommended XML/GML3.1.1 encoding of image CRS definitions". This document is based on the GML 3.1.1 OGC Recommendation Paper [04-092r4]. This document uses XML Schemas as specified by the W3C.

This document contains two informative annexes.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The Open Geospatial Consortium Inc. shall not be held responsible for identifying any or all such patent rights.

Introduction

This document recommends standard XML encodings of data defining monoscopic image coordinate reference systems. The scope of this encoding now includes unrectified and georectified images. The recommended CRSs for georectified images are recommended for multiple georectified images that are ready to be mosaicked together.

These recommended encodings are based on GML 3.1.1 and use XML Schemas. These image CRS definitions will often be referenced in data transferred between client and server software that implements various standardised interfaces. This specified definition data encoding is expected to be used by multiple OGC Implementation Specifications. That is, each of these specifications is expected to use a subset and/or superset of this recommended definition data.

The position or location of a point can be described using coordinates. Such coordinates are unambiguous only when the coordinate reference system on which those coordinates are based is fully defined. Each position is described by a set of coordinates based on a specified coordinate reference system. Coordinates are often used in datasets in which all coordinates belong to the same coordinate reference system. This paper specifies XML encoding of data defining image coordinate reference systems.

Recommended XML/GML 3.1.1 encoding of image CRS definitions

1 Scope

This OGC™ Recommendation Paper specifies standard XML encodings of definition data for monoscopic image coordinate reference systems and coordinate operations. These recommended encodings are based on GML 3.1.1 and use XML Schemas. This encoding is intended for use when referencing or transferring such definition data between client and server software that uses OGC standard interfaces, as specified in other documents. The expected uses of this definition data transfer include those described in Annex B of document [OGC 05-011].

The scope of this encoding now includes unrectified and georectified images. The recommended CRSs for georectified images are recommended for multiple georectified images that are ready to be mosaicked together. The current scope of this encoding does not include stereoscopic (multiple) images exploited together.

This Recommendation Paper specifies standard XML encodings of image CRS definition data applicable to multiple separate OGC interface Implementation Specifications. Each such Implementation Specification should specify one or more subsets and/or supersets of the definition data specified herein, each to be used for one or more purposes. That is, for each operation specified, the Implementation Specification should specify which specific image CRSs should be supported.

This document also defines a Profile of GML 3.1.1 for unrectified image CRSs. That profile includes all the elements and types in all the XML Schema fragments listed herein. That profile omits essentially all the CRS-related GML 3.1.1 elements and types not discussed in this document.

2 Conformance

Conformance with this specification shall be checked using all the relevant tests specified in each separate specification that normatively references this specification, and specifically references the applicable parts of this specification.

3 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this specification. For dated references, subsequent

amendments to, or revisions of, any of these publications do not apply. For undated references, the latest edition of the normative document referred to applies.

In addition to this document, this Recommendation Paper includes several normative XML Schema files and XML documents. After this document is approved, these files will be posted online at the URL <http://schemas.opengeospatial.net/ImageCRSS/1.1.0>. These XML Schema files are also bundled with the present document. In the event of a

discrepancy between the bundled and online versions of the XML Schema files, the online files shall be considered authoritative.

4 Terms and definitions

For the purposes of this specification, many of the definitions specified in Clauses 4 of the OGC Abstract Specification Topic 2 [04-046r3] and OWS Common Specification [OGC 05-008] shall apply. In addition, the following terms and definitions apply.

4.1

Application Schema

conceptual schema for data required by one or more applications [ISO 19101]

4.2

GML Application Schema

an XML Schema written according to the GML 3 rules for Application Schemas, which defines a vocabulary of geographic objects for a particular domain of discourse [GML 3.0]

4.3

object

an XML document element of a type derived from AbstractGMLType [GML 3.0]

4.4

profile

specified logical subset of XML Schema specified elements and types, defined to enhance interoperability and to curtail ambiguity [adapted from GML 3.0]

4.5

sequence

finite, ordered collection of related items (objects or values) that may be repeated [ISO 19107]

4.6

set

unordered collection of related items (**objects** or values) with no repetition [ISO 19107]

4.7

Uniform Resource Identifier (URI)

simple and extensible means for identifying a resource; a short string or address; classified as a name, a locator, or both [RFC 2396]

5 Conventions

5.1 Symbols (and abbreviated terms)

5.2 UML Notation

All diagrams in this document are Unified Modeling Language (UML) class diagrams, as described in Subclause 5.2 of [OGC 05-008].

5.3 Document terms and definitions

This document uses the specification terms defined in Subclause 5.3 of [OGC 05-008].

6 Unrectified image coordinate reference systems

6.1 Overview

The definition of the CRS of each unrectified image shall be represented by the SC_ImageCRS class in the UML model in Topic 2. (This SC_ImageCRS class is clearly the best alternative for modelling the CRS of each unrectified image.) The definition of this class shall be XML encoded using the CRS portion of GML 3.1.1.

This CRS of each unrectified image shall be identified as the CRS of feature geometries measured or computed in that unrectified image. This CRS will also be used for identification of the georeferencing coordinate transformations discussed in Subclause 7.2.2.1 of the “WCTS profile for unrectified images” [draft].

NOTE An unrectified image is usually georeferenced to a 3D CRS that represents positions relative to the earth (or other planet or moon). That 3D CRS can be represented by a 3D GeographicCRS, GeocentricCRS, or CompoundCRS in the UML model in Topic 2. Such a CompoundCRS combines a (2D) ProjectedCRS with a (1D) VerticalCRS.

This clause specifies how to define the CRS-related objects for unrectified images. These definitions are usually not required to be transferred between servers and clients.

However, these definitions shall be used in defining georeferencing coordinate transformations, and shall be referenced by those coordinate transformation definitions.

References to these CRSs shall be in the form of the anyURI type specified by XML Schema. As specified in Subclause 10.3 of [05-008], such an anyURI value can be either a URL with standard form or a URN in the “ogc” URN namespace.

6.2 Simple UML model

Figure 1 is a simplified UML class diagram extracted from Topic 2 that shows all the concrete (non-abstract) object classes and associations related to the SC_ImageCRS class. To keep this diagram simple, none of the class attributes are displayed. This diagram shows that the SC_ImageCRS class can use either a CS_CartesianCS or CS_AffineCS, but a CS_AffineCS is rarely used and is not required by this WCTS profile.

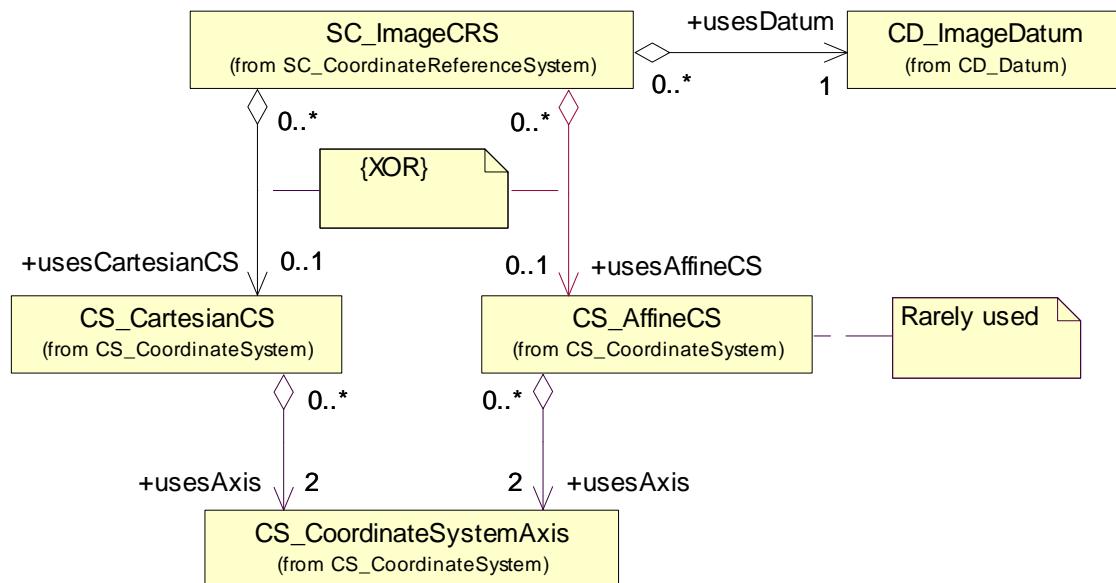

Figure 1— ImageCRS simple UML class diagram

Notice that the ImageCRS class does NOT include or reference any coordinate Transformations or operations which can be used to georeference this image. However, the coordinate Transformations or operations available to georeference an unrectified image can be saved with that image. These transformations must reference or include the SC_ImageCRS used for that unrectified image.

6.3 Full XML document template

An example template XML document completely defining an ImageCRS is:

```

<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml fragmentImageCRSS.xsd"
  gml:id="ImageTBDCRSpixelCenter">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <srsName>Image TBD CRS pixel centers</srsName>
  <!-- Specific image or group shall be identified by "TBD" in this
  srsName. -->
  <srsID>
    <name
      codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCenter">ImageTBDCRSpixelCenter</name>
    <!-- Specifies the URN that can be used to reference this image
    CRS. This URN includes the image name as a parameter. The specific
    image or group shall be identified by the "TBD" in the "name" value. -->
  </srsID>
  <remarks>Parameterized definition of 2D image coordinate reference
  systems with the origin at the center of the first pixel in the image
  file. This CRS definition can be used for any size image, since no
  image size is specified.
  </remarks>
  <usesCartesianCS>
    <CartesianCS gml:id="Grid2dSquareCS">
      <csName>2D square-cell grid based coordinate system</csName>
      <csID>
        <name
          codeSpace="urn:ogc:def:cs:OGC:1.0:">Grid2dSquareCS</name>
        </csID>
        <remarks>A 2D grid-based coordinate system for use by an image
        or other continuous grid coverage. It can be used for a grid of any
        size, since no grid size is defined. This coordinate system specifies
        that each row coordinate value shall be listed before the column
        coordinate value. The grid cells are assumed to be square, with the
        same grid spacing or pixel spacing in each direction.
        </remarks>
    </CartesianCS>
  </usesCartesianCS>
</ImageCRS>

```

In a grid coverage file, the "row" axis shall be the first axis by which grid points are sequenced, and the "column" axis shall be the second axis, as could be specified by the "scanDirection : Sequence(CharacterString)" attribute of the CV_SequenceRule class in Clause 8 of ISO 19123. With linear sequencing, the grid points in the first row shall be listed first, followed by other rows, with the grid points in each row listed in column number order. This relationship between the "row" and "column" names and the first grid points shall

apply whether this Grid2dSquareCS is associated with a grid file before or after that file is recorded.

The "row" and "column" axis names are used here although the "scanDirection : Sequence(CharacterString)" attribute may provide other axis names. Use of other axis names would require defining different CartesianCSs for other names, or adding other names as additional axisID values. The following XML includes the axis names "line" and "sample" as additional axisID values.

If not otherwise identified in an image file, the "row" axis shall be the first axis whose number of pixels is identified, and the "column" axis shall be the second axis, as could be specified by the "extent[0..1] : CV_GridEnvelope" attribute of the CV_Grid class in Clause 8 of ISO 19123. In either case, the first point in the grid coverage file is assumed to be numbered (1, 1), meaning row 1, column 1.

The first row in a grid is sometimes called the "top" row, the first column is sometimes called the "left" column, and the first grid point is then called the "upperLeft" point. If desired, those names can be used with this Grid2dSquareCS. However other names can also be used, since this Grid2dSquareCS has been defined so that it does not depend on such left/right, top/bottom, and up/down names. </remarks>

```

<usesAxis>
    <CoordinateSystemAxis gml:id="Row"
gml: uom="urn:ogc:def:uom:OGC:1.0:GridSpacing">
        <name>Grid row axis</name>
        <axisID>
            <name
codeSpace="urn:ogc:def:axis:OGC:1.0:">Row</name>
            </axisID>
            <remarks>For this grid axis, row coordinate values match
grid row numbers, but allow fractional coordinate values between grid
points. The first row in a grid is sometimes called the "top" row, so
the direction of this axis is "down", but these terms are not required.
</remarks>
            <axisAbbrev>R</axisAbbrev>

        <axisDirection>urn:ogc:def:axisDirection:OGC:1.0:rowPositive</axisDi
rection>
            </CoordinateSystemAxis>
        </usesAxis>
        <usesAxis>
            <CoordinateSystemAxis gml:id="Column"
gml: uom="urn:ogc:def:uom:OGC:1.0:GridSpacing">
                <name>Grid column axis</name>
                <axisID>
                    <name
codeSpace="urn:ogc:def:axis:OGC:1.0:">Column</name>
                    </axisID>
                    <remarks>For this grid axis, column coordinate values
match grid column numbers, but allow fractional coordinate values
between grid points. The first column is sometimes called the "left"
column, so the direction of this axis is "right", but these terms are
not required. </remarks>
                    <axisAbbrev>C</axisAbbrev>

```

```

<axisDirection>urn:ogc:def:axisDirection:OGC:1.0:columnPositive</axisDirection>
    </CoordinateSystemAxis>
    </usesAxis>
</CartesianCS>
</usesCartesianCS>
<usesImageDatum>
    <ImageDatum gml:id="ImageDatumPixelCenter">
        <datumName>Origin at center of first pixel</datumName>
        <datumID>
            <name
codeSpace="urn:ogc:def:datum:OGC:1.0:">ImageDatumPixelCenter</name>
        </datumID>
        <remarks>A 2D image datum with the origin at the center of the
first pixel in the image file. In an image file, the pixels in the
first row are assumed to be listed first, followed by other rows, with
pixels in each row listed (and collected) in column number order.
</remarks>
        <anchorPoint>center of first pixel</anchorPoint>
        <pixelInCell
codeSpace="urn:ogc:def:pixelInCell:OGC:1.0:">cellCenter</pixelInCell>
        </ImageDatum>
    </usesImageDatum>
</ImageCRS>

```

6.4 Recommended simple XML document template

The above template XML document can be simplified by referencing the standard XML documents specified in Clause 8, becoming:

```

<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml fragmentImageCRSS.xsd"
gml:id="ImageTBDCRSpixelCenter">
    <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28 -->
    <srsName>Image TBD CRS pixel centers</srsName>
    <!-- Specific image or group shall be identified by "TBD" in this
srsName. -->
    <srsID>
        <name
codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCenter">ImageTBDCRSpix
elCenter</name>
        <!-- Specifies the URN that can be used to reference this image
CRS. This URN includes the image name as a parameter. The specific
image or group shall be identified by the "TBD" in the "name" value. -->
    </srsID>
    <remarks>Parameterized definition of 2D image coordinate reference
systems with the origin at the center of the first pixel in the image
file. This CRS definition can be used for any size image, since no
image size is specified.

```

This CRS definition is designed to be used for ungeorectified images, and is not expected to be used for a georectified image. This definition can be used for a georeferenced or ungeoreferenced image, where a georeferenced image CRS is associated with the coordinate Transformation(s) that georeference it. </remarks>

```

<usesCartesianCS
xlink:href="urn:ogc:def:cs:OGC:1.0:Grid2dSquareCS"/>
<usesImageDatum
xlink:href="urn:ogc:def:datum:OGC:1.0:ImageDatumPixelCenter"/>
</ImageCRS>
```

This simplified template XML document is recommended for use in defining the CRSSs of unrectified images. Of course, the included XML comments and <remarks> elements can be removed or edited.

The corresponding GML 3.1.1 XML Schema fragment for defining an ImageCRS is attached in the file fragmentImageCRSSs.xsd.

6.5 Full UML model

Figure 2 is a more complete UML class diagram extracted from Topic 2 that shows essentially all the classes and associations related to the SC_ImageCRS class.

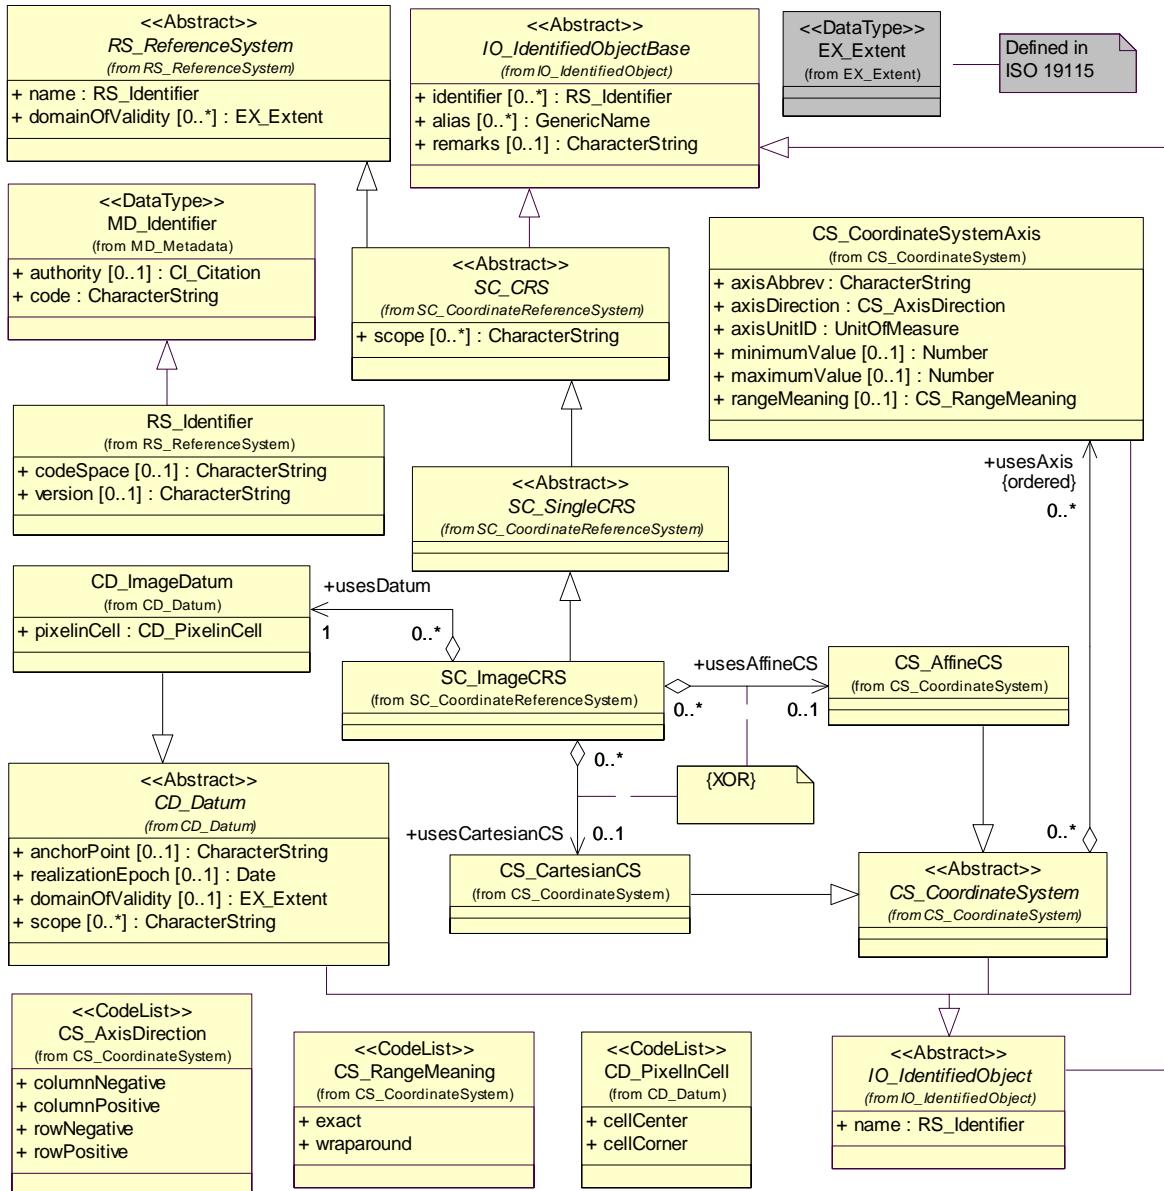

Figure 2 — ImageCRS full UML class diagram

7 Georectified image coordinate reference systems

7.1 Overview

The definition of the CRSs used for multiple georectified images should be represented by the SC_DerivedCRS class in the UML model in Topic 2. This SC_DerivedCRS class is not the only alternative for representing the definition of the CRS of a georectified image, but is recommended when multiple georectified images do or should use the same image CRS. Multiple georectified images must use the same CRS, or closely related CRSs, when those georectified images are directly ready for image mosaicking.

To support image mosaicking, these georectified images must use exactly the same pixel positions wherever they (do or might) overlap. This means that the grids must have the same baseCRSSs, grid point spacings in that CRS, and grid rotation in that CRS. When different origins are used, these origins must be grid points in the same SC_DerivedCRS.

This CRS for a georectified image should be identified as the CRS of feature geometries measured or computed in that georectified image. This CRS should also be used for identification of the georeferencing coordinate transformations discussed in Subclause 7.2.2.1 of the “WCTS profile for unrectified images” [draft].

NOTE 1 The `gml:RectifiedGrid` element in `grids.xsd` specifies the locations of a grid of points in a base or external coordinate reference system (CRS). The relationship between those grid points and the image pixels is largely defined by `gml:coverageFunction`. However, a `gml:_Coverage` is not a CRS, so does not define a CRS suitable for positions that are measured or computed in that georectified image. Also, it does not define a CRS that can be used as the sourceCRS or TargetCRS of a coordinate Transformation.

The definition of this class shall be XML encoded using the CRS portion of GML 3.1.1. The baseCRS of a georectified image SC_DerivedCRS is 2D and is usually either a GeographicCRS or a ProjectedCRS. The usesCS Coordinate System of a georectified image SC_DerivedCRS specifies a 2D grid of positions, with integer coordinate values designating grid point indices. The definedByConversion of a georectified image SC_DerivedCRS specifies the grid origin, grid spacing, and any rotation in the base CRS.

NOTE 2 Non-integer values of coordinates in the usesCS Coordinate System specify positions between the grid points.

This clause specifies how to define these CRS objects for georectified images. These definitions are usually not required to be transferred between servers and clients. However, these definitions shall be used in defining the definedByConversion and georeferencing coordinate transformations, and shall be referenced by those coordinate transformation definitions.

References to these CRSSs shall be in the form of the anyURI type specified by XML Schema. As specified in Subclause 10.3 of [05-008], such an anyURI value can be either a URL with standard form or a URN in the “ogc” URN namespace.

7.2 Simple UML model

Figure 3 is a simplified UML class diagram extracted from Topic 2 that shows all the concrete (non-abstract) object classes and associations related to the SC_DerivedCRS class when used for a georectified image. To keep this diagram simple, none of the class attributes are displayed. This diagram shows that the SC_DerivedCRS class can use as its baseCRS either a SC_GeographicCRS or SC_ProjectedCRS. The CC_Conversion class is detailed in Subclause 6.4, the SC_GeographicCRS class is detailed in Subclause 6.2, and the SC_ProjectedCRS class is detailed in Subclause 6.3, all in [OGC 05-011].

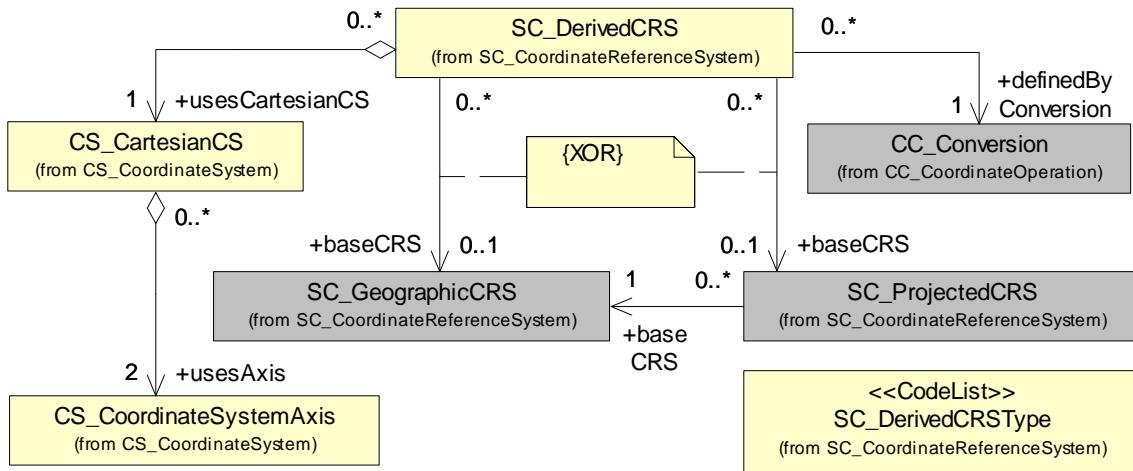

Figure 3 — DerivedCRS simple UML class diagram

Notice that this SC_DerivedCRS class does NOT include or reference any coordinate Transformations or operations which could be used to georeference the original image that was georectified. However, the coordinate Transformations and operations used to georeference and georectify the original image should be saved with the georectified image. One of these transformations must reference or include the SC_DerivedCRS used for that georectified image.

NOTE The image georectification process must use a georeferencing coordinate Transformation (or ConcatenatedOperation). That georeferencing Transformation must have the unrectified image CRS (ImageCRS) as its source (or target) CRS. That georeferencing Transformation could have the georectified image CRS (DerivedCRS) as its target (or source) CRS; in this case, the definedByConversion is not used to perform the georectification. Alternately, that georeferencing Transformation could have the (GeographicCRS or ProjectedCRS) baseCRS of the georectified image CRS (DerivedCRS) as its target (or source) CRS; in this case (discussed in Clause 8), the definedByConversion must also be used to perform the georectification. There are probably other useful alternatives.

7.3 Full XML document template

An example template XML document completely defining a DerivedCRS for a georectified image is:

```

<?xml version="1.0" encoding="UTF-8"?>
<DerivedCRS xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
  fragmentGeorectifiedGridCRSS.xsd" gml:id="GeorectifiedImageXXXXCRS">
  <!-- Specific georectified image or grid must be identified in this
  gml:id. -->
  <!-- Last updated 2005-03-08 -->
  <!-- ===== -->
  <srsName>Georectified Image XXXX CRS</srsName>
  <!-- Specific georectified image or grid must be identified in
  srsName. -->
  <srsID>
  
```

```

<name
codeSpace="urn:opengis:def:crs:OGC:0.20:GeorectifiedImageXXXXCRS">Geore
ctifiedImageXXXXCRS</name>
    <!-- Specific image must be identified in "name" value. -->
</srsID>
    <remarks>Template for georectified 2D image coordinate reference
system definition. In this CRS, the origin is at the center of the
first pixel in the georectified image file. This CRS template can be
used for any size georectified image, since no image size is specified.
A CRS definition using this template is expected to be needed and thus
created before the georectified image pixels are produced. The
coordinate Conversion used by this CRS definition is expected to NOT
closely approximate the reverse of the coordinate Transformation used
to georectify this image. This CRS template is not expected to be
useful for an ungeorectified image. </remarks>
<baseCRS xlink:href="urn:opengis:def:crs:EPSG:6.3:YYYY"/>
    <!-- Specific 2D CRS that was georectified into must be identified
in baseCRS, usually a ProjectedCRS or GeographicCRS -->
    <!-- ===== -->
<definedByConversion>
    <Conversion gml:id="GeorectifiedImageXXXXConversion">
        <!-- Specific georectified image or grid must be identified in
this gml:id. -->
        <coordinateOperationName>Georectified image XXXX
conversion</coordinateOperationName>
        <!-- Specific image must be identified in this
coordinateOperationName. -->
        <usesMethod>
            <OperationMethod gml:id="EPSG9624">
                <methodName>Affine general parametric
transformation</methodName>
                <methodID>
                    <name
codeSpace="urn:opengis:method:EPSG:6.3:">9624</name>
                    </methodID>
                    <methodFormula>
XT = A0 + A1. XS + A2.YS;
YT = B0 + B1. XS + B2.YS;
where XT , YT are the coordinates of a point P in the target
coordinate system;
XS ,YS are the coordinates of P in the source coordinate
system.

```

Reversibility: The parameter values for an affine transformation cannot be used for the reverse transformation. However, the reverse transformation is another affine transformation using the same formulas but with different parameter values. The reverse parameter values, indicated by a prime ('), can be calculated from those of the forward transformation as follows:

$$\begin{aligned}
D &= A1 \cdot B2 - A2 \cdot B1; \\
A0' &= (A2 \cdot B0 - B2 \cdot A0) / D; \\
B0' &= (B1 \cdot A0 - A1 \cdot B0) / D; \\
A1' &= +B2 / D; \\
A2' &= - A2 / D; \\
B1' &= - B1 / D; \\
B2' &= +A1 / D.
\end{aligned}$$

See Section 2.4.2.1 of EPSG Guidance Note 7. </methodFormula>

```

<!-- ===== -->
<usesCS>
    <CartesianCS gml:id="Grid2dSquareCS">
        <csName>2D square-cell grid based coordinate system</csName>
        <csID>
            <name
codeSpace="urn:ogc:def:cs:OGC:1.0:">Grid2dSquareCS</name>
        </csID>
        <remarks>A 2D grid-based coordinate system for use by an image
or other continuous grid coverage. It can be used for a grid of any
size, since no grid size is defined. This coordinate system specifies
that each row coordinate value shall be listed before the column
coordinate value. The grid cells are assumed to be square, with the
same grid spacing or pixel spacing in each direction.

```

In a grid coverage file, the "row" axis shall be the first axis by which grid points are sequenced, and the "column" axis shall be the second axis, as could be specified by the "scanDirection : Sequence(CharacterString)" attribute of the CV_SequenceRule class in Clause 8 of ISO 19123. With linear sequencing, the grid points in the first row shall be listed first, followed by other rows, with the grid points in each row listed in column number order. This relationship between the "row" and "column" names and the first grid points shall apply whether this Grid2dSquareCS is associated with a grid file before or after that file is recorded.

The "row" and "column" axis names are used here although the "scanDirection : Sequence(CharacterString)" attribute may provide other axis names. Use of other axis names would require defining different CartesianCSs for other names, or adding other names as additional axisID values. The following XML includes the axis names "line" and "sample" as additional axisID values.

If not otherwise identified in an image file, the "row" axis shall be the first axis whose number of pixels is identified, and the "column" axis shall be the second axis, as could be specified by the "extent[0..1] : CV_GridEnvelope" attribute of the CV_Grid class in Clause 8 of ISO 19123. In either case, the first point in the grid coverage file is assumed to be numbered (1, 1), meaning row 1, column 1.

The first row in a grid is sometimes called the "top" row, the first column is sometimes called the "left" column, and the first grid point is then called the "upperLeft" point. If desired, those names can be used with this Grid2dSquareCS. However other names can also be used, since this Grid2dSquareCS has been defined so that it does not depend on such left/right, top/bottom, and up/down names. </remarks>

```

<usesAxis>
    <CoordinateSystemAxis gml:id="Row"
gml: uom="urn:ogc:def:uom:OGC:1.0:GridSpacing">

                </usesAxis>
            </CartesianCS>
        </usesCS>
    </DerivedCRS>

```

The above template XML document uses the operation Method catalogued by EPSG using code 9624, because that EPSG method seems closest to the desired Method. However, various other operation Methods could be used, including Methods specified by the OGC. For example, one or more operation Methods could be defined that use parts of the gml:RectifiedGrid element as operation Parameters.

7.4 Recommended simple XML document template

The above example template XML document can be simplified by referencing the standard XML documents specified in Clause 9, and referencing the EPSG 9624 Operation Method, becoming:

```

<?xml version="1.0" encoding="UTF-8"?>
<DerivedCRS xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"

</DerivedCRS>
```

This simplified template XML document is recommended for use in defining the CRSs of georectified images. Of course, the OperationMethod can be changed, and the included XML comments and <remarks> elements can be removed or edited.

The corresponding GML 3.1.1 XML Schema fragment for defining a DerivedCRS for a georectified image is attached in the file fragmentGeorectifiedImageCRSs.xsd. An example XML document defining the EPSG 9624 Operation Method is also attached.

7.5 Full UML model

Figure 4 is a more complete UML class diagram extracted from Topic 2 that shows essentially all the classes and associations related to the SC_DerivedCRS class. Again, the CC_Conversion class is detailed in Subclause 6.4, the SC_GeographicCRS class is detailed in Subclause 6.2, and the SC_ProjectedCRS class is detailed in Subclause 6.3, all in [OGC 05-011]

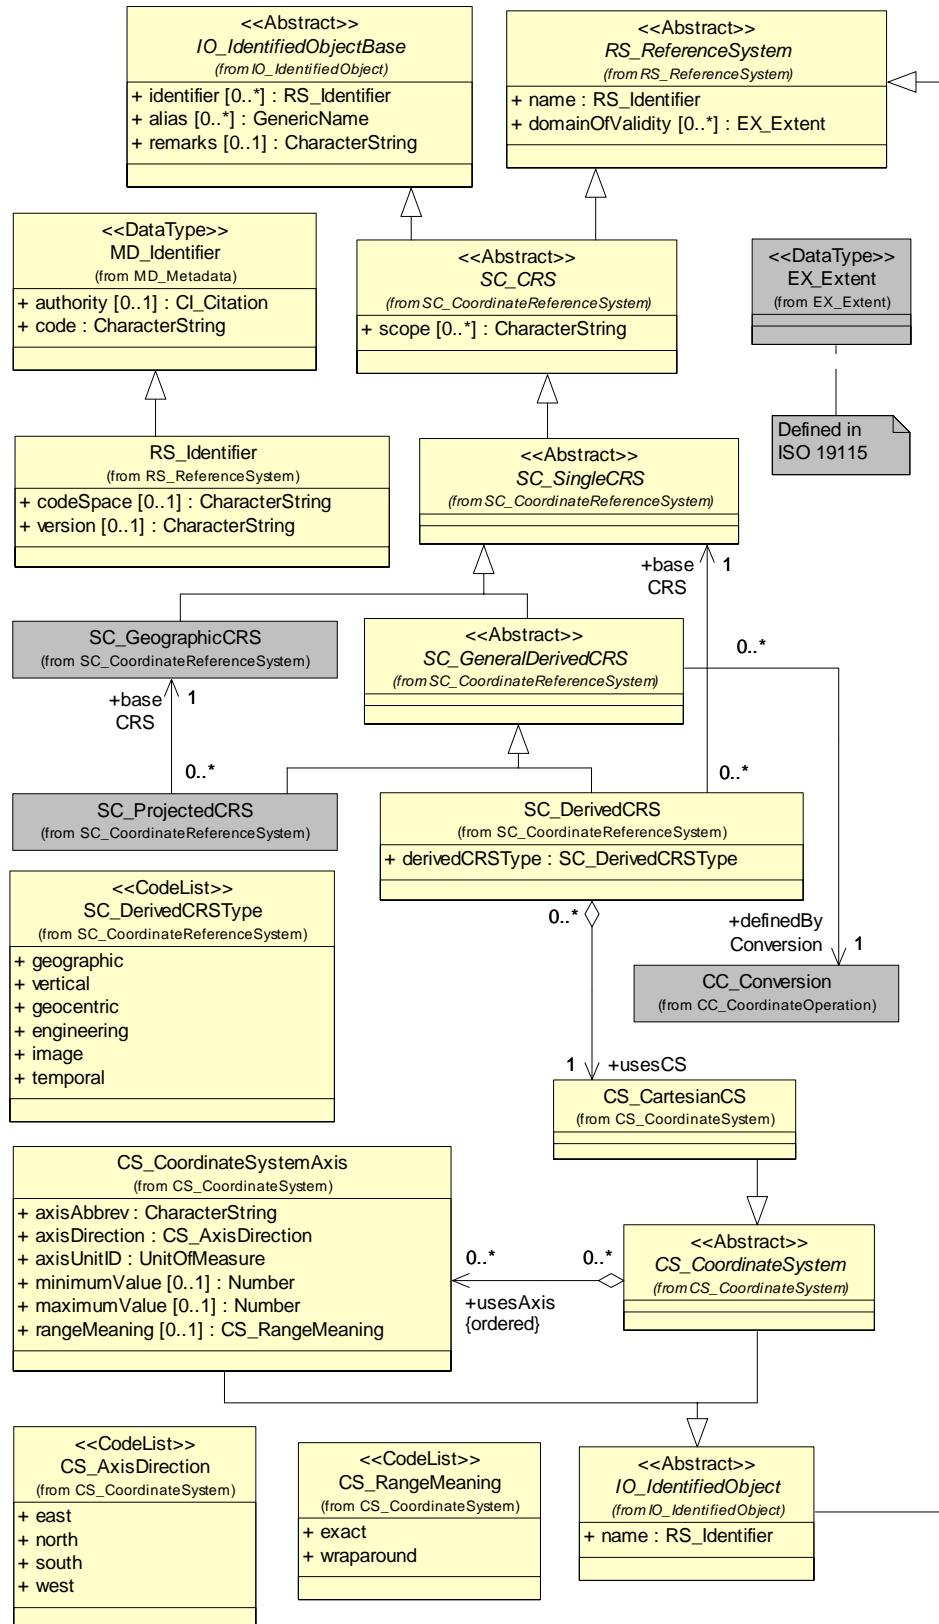

Figure 4 — DerivedCRS full UML class diagram

8 Coordinate transformations

8.1 Introduction

An unrectified image can be georeferenced by at least one coordinate transformation, between the CRS of the unrectified image and a reference CRS for positions relative to the earth (or other planet or moon). This georeferencing coordinate transformation can be represented by a coordinate Transformation in the UML model in Topic 2. A frequent alternative to using one Transformation is using a ConcatenatedOperation that sequentially combines two or more Transformations.

The reference CRS is usually 3D, while the unrectified image is only 2D. The georeferencing coordinate transformation is thus assumed to be from the reference 3D CRS to the 2D image CRS. If the reference CRS is 2D, that would be equivalent to combining the georeferencing coordinate transformation with the elevation model coordinate transformation discussed later in this clause.

8.2 Simple UML model

Figure 5 is a simplified UML class diagram extracted from Topic 2 for a CC_Transformation and CC_ConcatenatedOperation. This diagram shows most of the concrete (non-abstract) classes and associations related to the CC_Transformation and CC_ConcatenatedOperation classes, except for the CC_ParameterValueGroup and CC_OperationParameterGroup classes. The CC_ParameterValueGroup and CC_OperationParameterGroup classes are not always useful, but are useful for some operation methods used for image geometry models.

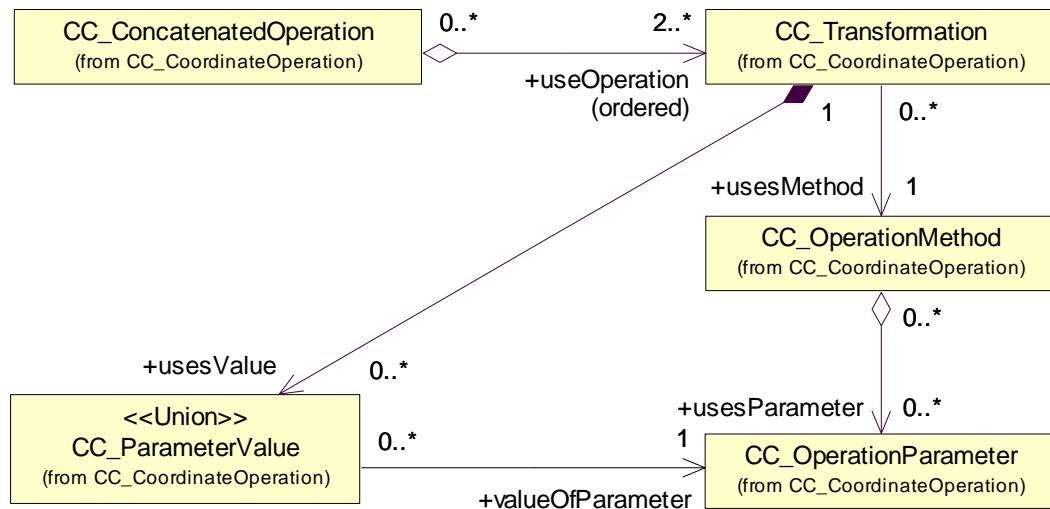

Figure 5 — Transformation and ConcatenatedOperation simple class diagram

To keep this diagram simple, none of the class attributes are displayed. The CC_ConcatenatedOperation class can also have usesOperation associations to the

CC_Conversion class, with each associated object of CC_Conversion class substituting for an object of CC_Transformation class in this UML model.

This simplified UML diagram does not include the two associations with the role names sourceCRS and targetCRS, required to the abstract SC_CRS class from both the CC_Transformation and CC_ConcatenatedOperation classes. For a georeferencing Transformation, the targetCRS will be a SC_ImageCRS and the sourceCRS will be the reference CRS used in that georeferencing, both being non-abstract subclasses of the SC_CRS class.

8.3 XML document example templates

8.3.1 Image georeferencing Transformation full template

An example template XML document defining a CC_Transformation for image georeferencing is:

```
<?xml version="1.0" encoding="UTF-8"?>
<Transformation xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"

          codeSpace="urn:ogc:def:method:OGC:0.0:">ReplacementSensorModel</name>
      </methodID>
      <remarks>This operation method is for a coordinate
      Transformation that georeferences an unrectified image using the
      Replacement Sensor Model (RSM). </remarks>
    </OperationMethod>
  </usesMethod>
  <methodFormula>urn:ogc:def:method:OGC:0.0:ReplacementSensorModel.
  </methodFormula>
  <sourceDimensions>3</sourceDimensions>
  <targetDimensions>2</targetDimensions>
  <usesParameter>
    <OperationParameter gml:id="RSMPParameters">
      <parameterName>Parameters for Replacement Sensor Model
      (RSM). </parameterName>
      <parameterID>
```

```

        <name
codeSpace="http://baesystems.com/rsm/rsmParameters" />
    </parameterID>
        <remarks>The value of this operation parameter is the
URL of a file containing all the parameters for the Replacement Sensor
Model (RSM) for the specific image. </remarks>
    </OperationParameter>
</usesParameter>
</OperationMethod>
</usesMethod>
<usesValue>

<valueFile>http://baesystems.com/rsm/rsmParameterValues/TBD.xml</val
ueFile>
    <valueOfParameter
xlink:href="http://baesystems.com/rsm/rsmParameters" />
</usesValue>
</Transformation>
```

This example template uses the “Replacement Sensor Model (RSM)” Operation Method for georeferencing Transformations. That example method uses one parameter named “RSMPParameters” that contains the URL of a file containing all the RSM parameters for a specific image. That RSM Operation Method is an extension of the “Universal image geometry model transformation” discussed in Subclause A.3.

8.3.2 Image georeferencing Transformation recommended simple template

That Operation Method could be specified elsewhere and referenced by this georeferencing Transformations template, instead of being included in-line. Doing this produces the simplified template XML document:

```

<?xml version="1.0" encoding="UTF-8"?>
<Transformation xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
fragmentTransformations.xsd"
gml:id="TemplateGeoreferencingTransformation">
    <!-- Primary editor: Arliss Whiteside. Last updated 2005-03-08 -->
    <coordinateOperationName>Example template for image georeferencing
coordinate Transformations</coordinateOperationName>
    <operationVersion>1.0</operationVersion>
    <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
        <!-- This sourceCRS must be 3D. -->
    </sourceCRS>
    <targetCRS
xlink:href="urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD" />
    <usesMethod
xlink:href="urn:ogc:def:method:OGC:0.0:ReplacementSensorModel" />
    <usesValue>

    <valueFile>http://baesystems.com/rsm/rsmParameterValues/TBD.xml</val
ueFile>
```

```

<valueOfParameter
xlink:href="http://baesystems.com/rsm/rsmParameters" />
</usesValue>
</Transformation>
```

This simplified template XML document is recommended for use in defining the image georeferencing coordinate Transformations. Of course, the OperationMethod can be changed, and the included XML comments and <remarks> elements can be removed or edited.

8.3.3 Grid elevation model Transformation full template

A template XML document defining a CC_Transformation for a grid elevation model is:

```

<?xml version="1.0" encoding="UTF-8"?>
<Transformation xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    fragmentTransformations.xsd"
  gml:id="TemplateGridElevationModelTransformation">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-03-08 -->
  <coordinateOperationName>Template for grid elevation model
  coordinate Transformations</coordinateOperationName>
  <operationVersion>1.0</operationVersion>
  <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
    <!-- This sourceCRS must be 2D. -->
  </sourceCRS>
  <targetCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
    <!-- This targetCRS must be 3D. -->
  </targetCRS>
  <usesMethod>
    <OperationMethod gml:id="GridElevationModel">
      <methodName>Grid elevation model</methodName>
      <methodID>
        <name
codeSpace="urn:ogc:def:method:OGC:0.0:">GridElevationModel</name>
      </methodID>
      <remarks>This operation method is for a coordinate
      Transformation that implements an elevation model using grid elevation
      data. </remarks>
      <methodFormula>The elevation value for the input horizontal
      position shall be bilinear interpolated between the surrounding four
      grid points, and added to the input horizontal coordinates.
    </methodFormula>
      <sourceDimensions>2</sourceDimensions>
      <targetDimensions>3</targetDimensions>
      <usesParameter>
        <OperationParameter gml:id="GridElevationData">
          <parameterName>Grid Elevation Data</parameterName>
          <parameterID>
            <name
codeSpace="urn:ogc:def:parameter:OGC:0.0:">GridElevationData</name>
          </parameterID>
```

```

        <remarks>The value of this operation parameter is the
URL of a source of grid elevation data, in the 3D targetCRS of the
coordinate Transformation that contains the value of this operation
parameter. </remarks>
        </OperationParameter>
    </usesParameter>
</OperationMethod>
</usesMethod>
<usesValue>
    <valueFile>http://baesystems.com/DEM/TBD</valueFile>
    <valueOfParameter
xlink:href="urn:ogc:def:parameter:OGC:0.0:GridElevationData"/>
    </usesValue>
</Transformation>

```

This example template uses the “GridElevationModel” Operation Method. That example method uses one parameter named “GridElevationData” that contains the URL of a file containing the grid elevation data.

8.3.4 Grid elevation model Transformation recommended simple template

That Operation Method could be specified elsewhere and referenced by this GridElevationModel Transformations template, instead of being included in-line. Doing this produces the simplified template XML document:

```

<?xml version="1.0" encoding="UTF-8"?>
<Transformation xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
fragmentTransformations.xsd"
gml:id="TemplateGridElevationModelTransformation">
    <!-- Primary editor: Arliss Whiteside. Last updated 2005-03-08 -->
    <coordinateOperationName>Template for grid elevation model
coordinate Transformations</coordinateOperationName>
    <operationVersion>1.0</operationVersion>
    <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
        <!-- This sourceCRS must be 2D. -->
    </sourceCRS>
    <targetCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
        <!-- This targetCRS must be 3D. -->
    </targetCRS>
    <usesMethod
xlink:href="urn:ogc:def:method:OGC:0.0:GridElevationModel"/>
    <usesValue>
        <valueFile>http://baesystems.com/DEM/TBD</valueFile>
        <valueOfParameter
xlink:href="urn:ogc:def:parameter:OGC:0.0:GridElevationData"/>
        </usesValue>
    </Transformation>

```

This simplified template XML document is recommended for use in defining grid elevation model coordinate Transformations. Of course, the OperationMethod can be

changed, and the included XML comments and <remarks> elements can be removed or edited.

8.3.5 Concatenated operation full template

A template XML document defining a CC_ConcatenatedOperation that combines the two full transformation templates above is:

```
<?xml version="1.0" encoding="UTF-8"?>
<ConcatenatedOperation xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    fragmentTransformations.xsd" gml:id="TemplateConcatenatedOperation">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-04-13 -->
  <coordinateOperationName>Template for
ConcatenatedOperation</coordinateOperationName>
  <remarks>Template for coordinate ConcatenatedOperation to
unrectified image coordinates from ground CRS coordinates. </remarks>
  <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
    <!-- This sourceCRS must be 2D. -->
  </sourceCRS>
  <targetCRS
xlink:href="urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD" />
  <usesSingleOperation>
    <Transformation
      gml:id="TemplateGridElevationModelTransformation">
        <coordinateOperationName>Template for grid elevation model
coordinate Transformations</coordinateOperationName>
        <operationVersion>1.0</operationVersion>
        <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
          <!-- This sourceCRS must be the same as the sourceCRS
above. -->
        </sourceCRS>
        <targetCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
          <!-- This targetCRS must be 3D. -->
        </targetCRS>
        <usesMethod>
          <OperationMethod gml:id="GridElevationModel">
            <methodName>Grid elevation model</methodName>
            <methodID>
              <name
codeSpace="urn:ogc:def:method:OGC:0.0:">GridElevationModel</name>
            </methodID>
            <remarks>This operation method is for a coordinate
Transformation that implements an elevation model using grid elevation
data. </remarks>
            <methodFormula>The elevation value for the input
horizontal position shall be bilinear interpolated between the
surrounding four grid points, and added to the input horizontal
coordinates. </methodFormula>
            <sourceDimensions>2</sourceDimensions>
            <targetDimensions>3</targetDimensions>
            <usesParameter>
              <OperationParameter gml:id="GridElevationData">
                <parameterName>Grid Elevation Data</parameterName>
```

```

        <parameterID>
            <name
codeSpace="urn:ogc:def:parameter:OGC:0.0:>GridElevationData</name>
            </parameterID>
            <remarks>The value of this operation parameter is
the URL of a source of grid elevation data, in the 3D targetCRS of the
coordinate Transformation that contains the value of this operation
parameter. </remarks>
        </OperationParameter>
    </usesParameter>
    </OperationMethod>
</usesMethod>
<usesValue>
    <valueFile>http://baesystems.com/DEM/TBD</valueFile>
    <valueOfParameter
xlink:href="urn:ogc:def:parameter:OGC:0.0:GridElevationData"/>
    </usesValue>
</Transformation>
</usesSingleOperation>
<usesSingleOperation>
    <Transformation gml:id="TemplateGeoreferencingTransformation">
        <coordinateOperationName>Template for image georeferencing
coordinate Transformation</coordinateOperationName>
        <operationVersion>1.0</operationVersion>
        <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
            <!-- This sourceCRS must be the same as the targetCRS
above. -->
        </sourceCRS>
        <targetCRS
xlink:href="urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD"/>
        <usesMethod>
            <OperationMethod gml:id="ReplacementSensorModel">
                <methodName>Replacement Sensor Model (RSM) coordinate
Transformation</methodName>
                <methodID>
                    <name
codeSpace="urn:ogc:def:method:OGC:0.0:>ReplacementSensorModel</name>
                    </methodID>
                    <remarks>This operation method is for a coordinate
Transformation that georeferences an unrectified image using the
Replacement Sensor Model (RSM). </remarks>
                <methodFormula>urn:ogc:def:method:OGC:0.0:ReplacementSensorModel.
</methodFormula>
                <sourceDimensions>3</sourceDimensions>
                <targetDimensions>2</targetDimensions>
                <usesParameter>
                    <OperationParameter gml:id="RSMPARAMETERS">
                        <parameterName>Parameters for Replacement Sensor
Model (RSM). </parameterName>
                    <parameterID>
                        <name
codeSpace="http://baesystems.com/rsm/rsmParameters"/>
                    </parameterID>
                    <remarks>The value of this operation parameter is
the URL of a file containing all the parameters for the Replacement
Sensor Model (RSM) for the specific image. </remarks>
                </usesParameter>
            </OperationMethod>
        </usesMethod>
    </Transformation>
</usesSingleOperation>

```

```

        </OperationParameter>
    </usesParameter>
    </OperationMethod>
</usesMethod>
<usesValue>

    <valueFile>http://baesystems.com/rsm/rsmParameterValues/TBD.xml</valueFile>
        <valueOfParameter
xlink:href="http://baesystems.com/rsm/rsmParameters" />
        <usesValue>
    </Transformation>
</usesSingleOperation>
</ConcatenatedOperation>

```

8.3.6 Concatenated operation recommended simple template

The above template uses the “Replacement Sensor Model (RSM)” and “GridElevationModel” Operation Methods. Those Operation Methods could be specified elsewhere and referenced by this template, instead of being included in-line. Doing this produces the simplified template XML document:

```

<?xml version="1.0" encoding="UTF-8"?>
<ConcatenatedOperation xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
fragmentTransformations.xsd" gml:id="TemplateConcatenatedOperation">
    <!-- Primary editor: Arliss Whiteside. Last updated 2005-04-13 -->
    <coordinateOperationName>Template for
ConcatenatedOperation</coordinateOperationName>
    <remarks>Template for coordinate ConcatenatedOperation to
unrectified image coordinates from ground CRS coordinates. </remarks>
    <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
        <!-- This sourceCRS must be 2D. -->
    </sourceCRS>
    <targetCRS
xlink:href="urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD" />
    <usesSingleOperation>
        <Transformation
gml:id="TemplateGridElevationModelTransformation">
            <coordinateOperationName>Template for grid elevation model
coordinate Transformations</coordinateOperationName>
            <operationVersion>1.0</operationVersion>
            <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
                <!-- This sourceCRS must be the same as the sourceCRS
above. -->
            </sourceCRS>
            <targetCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
                <!-- This targetCRS must be 3D. -->
            </targetCRS>
            <usesMethod
xlink:href="urn:ogc:def:method:OGC:0.0:GridElevationModel" />
            <usesValue>
                <valueFile>http://baesystems.com/DEM/TBD</valueFile>

```

```

        <valueOfParameter
xlink:href="urn:ogc:def:parameter:OGC:0.0:GridElevationData" />
    </usesValue>
</Transformation>
</usesSingleOperation>
<usesSingleOperation>
    <Transformation gml:id="TemplateGeoreferencingTransformation">
        <coordinateOperationName>Template for image georeferencing
coordinate Transformation</coordinateOperationName>
        <operationVersion>1.0</operationVersion>
        <sourceCRS xlink:href="urn:ogc:def:crs:EPSG:6.3:TBD">
            <!-- This sourceCRS must be the same as the targetCRS
above. -->
        </sourceCRS>
        <targetCRS
xlink:href="urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD" />
        <usesMethod
xlink:href="urn:ogc:def:method:OGC:0.0:ReplacementSensorModel" />
        <usesValue>

        <valueFile>http://baesystems.com/rsm/rsmParameterValues/TBD.xml</val
ueFile>
            <valueOfParameter
xlink:href="http://baesystems.com/rsm/rsmParameters" />
            </usesValue>
</Transformation>
</usesSingleOperation>
</ConcatenatedOperation>

```

This simplified template XML document is recommended for use in defining such concatenated Transformations. Of course, the OperationMethods can be changed, and the included XML comments and <remarks> elements can be removed or edited.

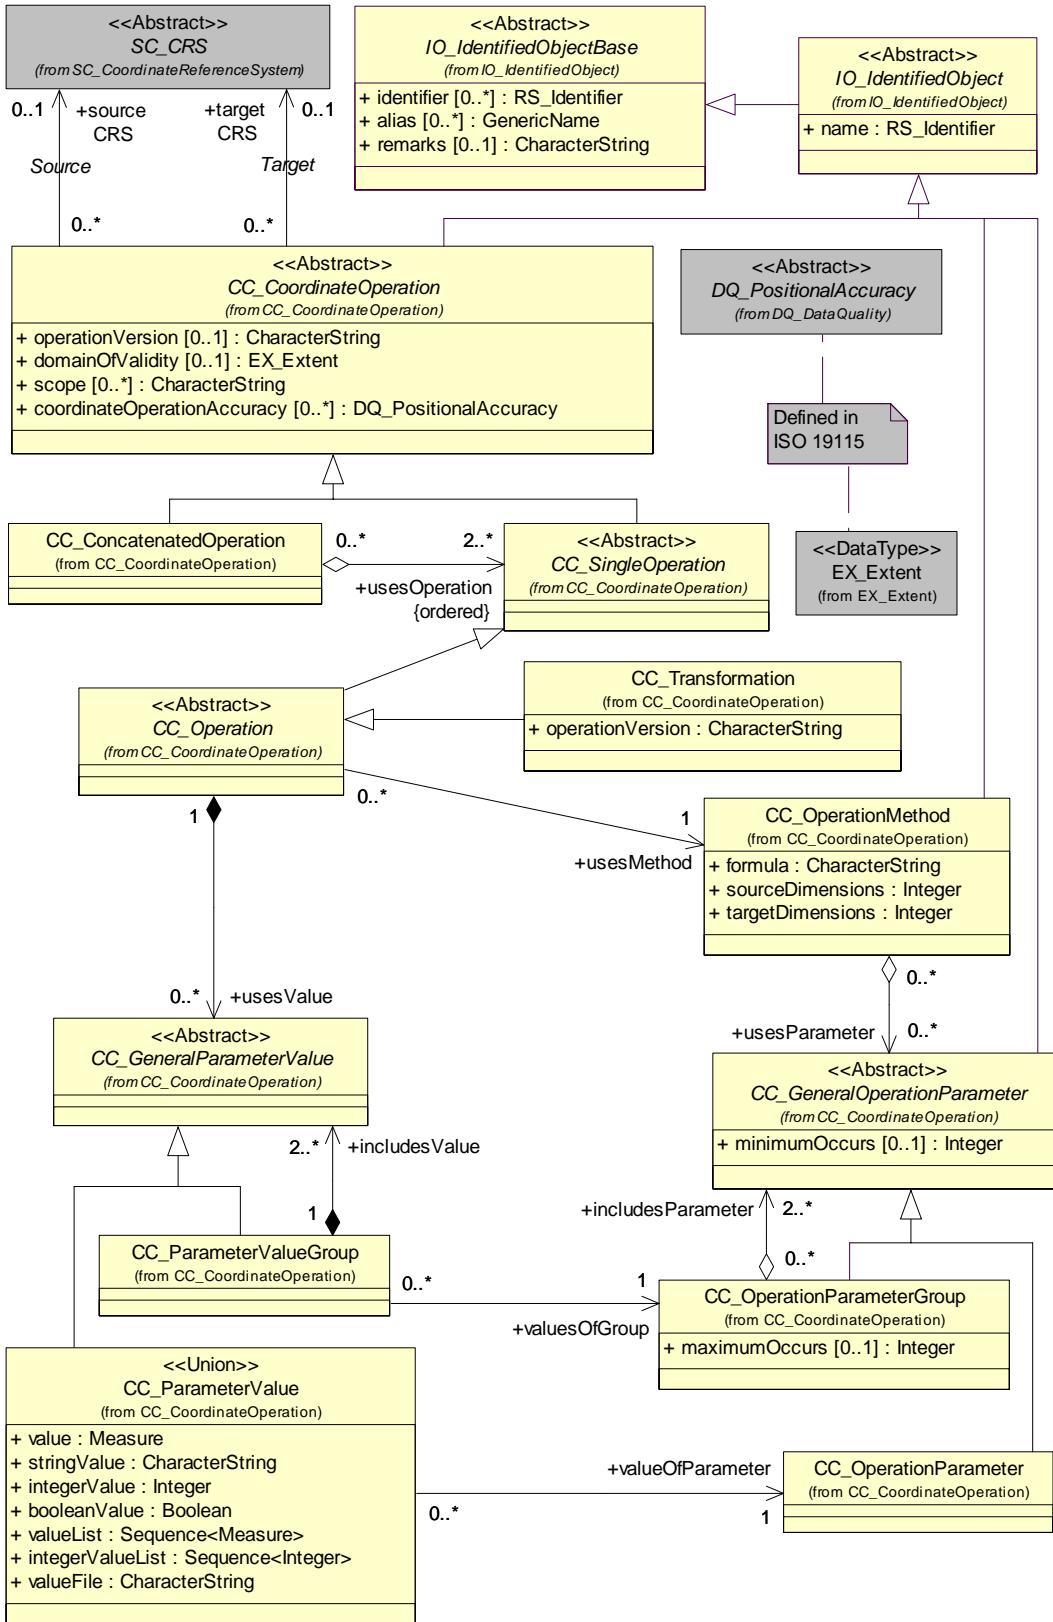

8.3.7 XML schema fragment

The corresponding GML 3.1.1 XML Schema fragment for defining a CC_Transformation or CC_ConcatenatedOperation is attached in file fragmentTransformations.xsd. That XML Schema fragment omits the encoding of the validArea and positionalAccuracy attributes in the UML model. Example XML documents defining the Operation Methods that might be defined elsewhere are also attached

8.4 Full UML model

Figure 6 is a more complete UML class diagram extracted from Topic 2 for a coordinate CC_Transformation and CC_ConcatenatedOperation. This diagram shows essentially all the classes and associations related to the CC_Transformation and CC_ConcatenatedOperation classes, except for the:

- Contents of the DQ_PositionalAccuracy and EX_Extent classes, defined in ISO 19115
- Contents of the SC_CRS class, such asdefined in Clauses 6 and 7

**Figure 6 — Transformation and ConcatenatedOperation full UML class diagram**

Notice that each Transformation and ConcatenatedOperation inherits two associations with the role names sourceCRS and targetCRS, required to the abstract SC_CRS class from both the CC_Transformation and CC_ConcatenatedOperation classes. For a georeferencing Transformation, the targetCRS will be a SC_ImageCRS and the sourceCRS will be the reference CRS used in that georeferencing, both being non-abstract subclasses of the SC_CRS class.

9 Standard URNs and XML definitions

9.1 Overview

This clause specifies a standard set of definitions and corresponding URNs that shall be used whenever applicable for unrectified and georectified images. These definitions are encoded in GML 3.1.1 [OGC 04-092r4].

Whenever applicable, CRS definitions for images shall use the eight URNs in the “ogc” URN namespace that are specified in Table 1. The first two these URNs use the format for not-completely-specified objects specified in Subclause 7.2 of “URNs of definitions in ogc namespace” [OGC 05-010]. The remaining six of these URNs use the format for single objects specified in Subclause 7.1.

Table 1 — Standard URNs for unrectified images CRSSs

URN	Object name & gml:id	Definition specified in
urn:ogc:def:crs:OGC:0.0: ImageCRSpixelCenter:TBD a	ImageTBDCRSpixelCenter	Subclause 7.2
urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCorner:TBD a	ImageTBDCRSpixelCorner	Subclause 7.3
urn:ogc:def:cs:OGC:0.0:Grid2dSquareCS	Grid2dSquareCS	Subclause 7.4
urn:ogc:def:axis:OGC:0.0:Row	Row	Subclause 7.5
urn:ogc:def:axis:OGC:0.0:Column	Column	Subclause 7.6
urn:ogc:def:datum:OGC:0.0:ImageDatumPixelCenter	ImageDatumPixelCenter	Subclause 7.7
urn:ogc:def:datum:OGC:0.0:ImageDatumPixelCorner	ImageDatumPixelCorner	Subclause 7.8
urn:ogc:def:uom:OGC:0.0:GridSpacing	GridSpacing	Subclause 7.9
a This “TBD” shall be replaced by the image identifier alphanumeric character string.		

NOTE These image CRSSs and components were defined and used in the XML document attached to Discussion Paper “Image CRSSs for IH4DS” [OGC 05-014]. The definitions of these components have now been updated to use a later version of the CRS Schemas, in [OGC 04-092r4].

9.2 Image CRSSs with origin in centre of first pixel

The URN value “urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCenter:TBD” shall reference the definition of an (unrectified) image CRS with its origin in the centre of the first pixel in the image file. This image CRS shall be for the image, or image group, whose alphanumeric character string identifier is substituted for the “TBD” in this URN.

NOTE 1 This document does not specify any format for an image alphanumeric identifier, since many different formats are used for such identifiers. One such format could concatenate a camera identifier with the image collection date and time.

The definitions of these image CRSs shall be the same as can be XML encoded using GML 3.1.1 as:

```
<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/coordinateReferenceSystems.xsd"
  gml:id="ImageTBDCRSpixelCenter">
  <!-- Specific image or group shall be identified by "TBD" in this
  gml:id. -->
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <!-- ===== -->
  <srsName>Image TBD CRS pixel centers</srsName>
  <!-- Specific image or group shall be identified by "TBD" in this
  srsName. -->
  <srsID>
    <name
      codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCenter">TBD</name>
      <!-- Specifies the URN that can be used to reference this image
      CRS. This URN includes the image name as a parameter. The specific
      image or group shall be identified by the "TBD" in the "name" value. -->
    </srsID>
    <remarks>Parameterized definition of 2D image coordinate reference
    systems with the origin at the center of the first pixel in the image
    file. This CRS definition can be used for any size image, since no
    image size is specified.
  </remarks>
  <usesCartesianCS
    xlink:href="urn:ogc:def:cs:OGC:1.0:Grid2dSquareCS" />
  <usesImageDatum
    xlink:href="urn:ogc:def:datum:OGC:1.0:ImageDatumPixelCenter" />
</ImageCRS>
```

NOTE 2 It is not expected to be necessary in most cases to produce an XML document that specifies the image CRS for a specific image identifier, since this CRS definition can be referenced using the specified URN value with the “TBD” replaced by the specific image identifier. However, it is possible to do this, as shown in the following example.

EXAMPLE If this XML document were modified to specify the image CRS with its origin in the centre of first pixel for an image with the identifier “C543D041201T084027”, this XML document could be:

```
<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
```

```

xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
../gml/3.1.1/base/coordinateReferenceSystems.xsd"
gml:id="ImageC543D041201T084027CRSpixelCenter">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <srsName>Image C543D041201T084027 CRS pixel centers</srsName>
  <srsID>
    <name
codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCenter:">C543D041201T084027</na
me>
    <!-- This name specifies the URN by which this CRS can be referenced. -->
  </srsID>
  <usesCartesianCS xlink:href="urn:ogc:def:cs:OGC:1.0:Grid2dSquareCS" />
  <usesImageDatum
xlink:href="urn:ogc:def:datum:OGC:1.0:ImageDatumPixelCenter" />
</ImageCRS>

```

9.3 Image CRSSs with origin in corner of first pixel

The URN value “urn:ogc:def:crs:OGC:0.0:ImageCRSpixelCorner:TBD” shall reference the definition of an (unrectified) image CRS with its origin in the outside corner of the first pixel in the image file. This image CRS shall be for the image, or image group, whose identifier is substituted for the “TBD” in this URN.

The definitions of these image CRSSs shall be the same as can be XML encoded using GML 3.1.1 as:

```

<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
../gml/3.1.1/base/coordinateReferenceSystems.xsd"
gml:id="ImageTBDCRSpixelCorner">
  <!-- Specific image or group shall be identified by "TBD" in this
gml:id. -->
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28 -->
  <!-- ===== -->
  <srsName>Image TBD CRS pixel corner</srsName>
  <!-- Specific image or group shall be identified by "TBD" in this
srsName. -->
  <srsID>
    <name
codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCorner:">TBD</name>
    <!-- Specifies the URN that can be used to reference this image
CRS. This URN includes the image name as a parameter. The specific
image or group shall be identified by the "TBD" in the "name" value. -->
  </srsID>
  <remarks>Parameterized definition of 2D image coordinate reference
systems with the origin at the outside corner of the first pixel in the
image file. This CRS definition can be used for any size image, since
no image size is specified.

```

This CRS definition is designed to be used for ungeorectified images, and is not expected to be used for a georectified image. This definition can be used for a georeferenced or ungeoreferenced image, where a georeferenced image CRS is associated with the coordinate Transformation(s) that georeference it. </remarks>

```
<usesCartesianCS
xlink:href="urn:ogc:def:cs:OGC:1.0:Grid2dSquareCS"/>
<usesImageDatum
xlink:href="urn:ogc:def:datum:OGC:1.0:ImageDatumPixelCorner"/>
</ImageCRS>
```

EXAMPLE If this XML document were modified to specify the image CRS with its origin in the outside corner of first pixel for an image with the identifier “C543D041201T084027”, this XML document could be:

```
<?xml version="1.0" encoding="UTF-8"?>
<ImageCRS xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
../gml/3.1.1/base/coordinateReferenceSystems.xsd"
gml:id="ImageC543D041201T084027CRSpixelCorner">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <srsName>Image C543D041201T084027 CRS pixel corners</srsName>
  <srsID>
    <name
codeSpace="urn:ogc:def:crs:OGC:1.0:ImageCRSpixelCorner">C543D041201T084027</na
me>
    <!-- This name specifies the URN by which this CRS can be referenced. -->
  </srsID>
  <usesCartesianCS xlink:href="urn:ogc:def:cs:OGC:1.0:Grid2dSquareCS"/>
  <usesImageDatum
xlink:href="urn:ogc:def:datum:OGC:1.0:ImageDatumPixelCorner"/>
</ImageCRS>
```

9.4 Grid 2D square coordinate system

The URN “urn:ogc:def:cs:OGC:0.0:Grid2dSquareCS” shall reference the definition of a Coordinate System for a 2D grid with square grid cells. The definition of this grid shall be the same as can be XML encoded using GML 3.1.1 as:

```
<?xml version="1.0" encoding="UTF-8"?>
<CartesianCS xmlns="http://www.opengis.net/gml"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.opengis.net/gml
../gml/3.1.1/base/coordinateSystems.xsd" gml:id="Grid2dSquareCS">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <csName>2D square-cell grid based coordinate system</csName>
  <csID>
    <name codeSpace="urn:ogc:def:cs:OGC:1.0:>Grid2dSquareCS</name>
  </csID>
  <remarks>2D grid-based coordinate system for use by an image or
other continuous grid coverage. It can be used for a grid of any size,
since no grid size is defined. This coordinate system specifies that
each row coordinate value will be listed before the column coordinate
```

value. The grid cells are assumed to be square, with the same grid spacing or pixel spacing in each direction.

In a grid coverage file, the "row" axis shall be the first axis by which grid points are sequenced, and the "column" axis shall be the second axis, as could be specified by the "scanDirection : Sequence(CharacterString)" attribute of the CV_SequenceRule class in Clause 8 of ISO 19123. With linear sequencing, the grid points in the first row shall be listed first, followed by other rows, with the grid points in each row listed in column number order. This relationship between the "row" and "column" names and the first grid points shall apply whether this Grid2dSquareCS is associated with a grid file before or after that file is recorded.

The "row" and "column" axis names are used here although the "scanDirection : Sequence(CharacterString)" attribute may provide other axis names. Use of other axis names would require defining different CartesianCSs for other names, or adding other names as additional axisID values. The following XML includes the axis names "line" and "sample" as additional axisID values.

If not otherwise identified in an image file, the "row" axis shall be the first axis whose number of pixels is identified, and the "column" axis shall be the second axis, as could be specified by the "extent[0..1] : CV_GridEnvelope" attribute of the CV_Grid class in Clause 8 of ISO 19123. In either case, the first point in the grid coverage file is assumed to be numbered (1, 1), meaning row 1, column 1.

The first row in a grid is sometimes called the "top" row, the first column is sometimes called the "left" column, and the first grid point is then called the "upperLeft" point. If desired, those names can be used with this Grid2dSquareCS. However other names can also be used, since this Grid2dSquareCS has been defined so that it does not depend on such left/right, top/bottom, and up/down names. </remarks>

```
<usesAxis xlink:href="urn:ogc:def:axis:OGC:1.0:Row"/>
<usesAxis xlink:href="urn:ogc:def:axis:OGC:1.0:Column"/>
</CartesianCS>
```

This xml document references the two standard grid axes specified below.

9.5 Row coordinate axis

The URN "urn:ogc:def:axis:OGC:0.0:Row" shall reference the definition of the row coordinate axis for a 2D square grid coordinate system. The definition of this row axis shall be the same as can be XML encoded using GML 3.1.1 as:

```
<?xml version="1.0" encoding="UTF-8"?>
<CoordinateSystemAxis xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/coordinateSystems.xsd" gml:id="Row"
  gml: uom="urn:ogc:def:uom:OGC:1.0:GridSpacing">
```

```

<!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28 -->
<name>Grid row axis</name>
<axisID>
  <name codeSpace="urn:ogc:def:axis:OGC:1.0:>Row</name>
</axisID>
<axisID>
  <name codeSpace="urn:ogc:def:axis:OGC:1.0:>Line</name>
</axisID>
<remarks>For this first grid axis, row coordinate values match grid
row numbers, but allow fractional coordinate values between grid
points. The first row in a grid is sometimes called the "top" row, so
the direction of this axis is "down", but these terms are not required.
</remarks>
<axisAbbrev>R</axisAbbrev>
<axisDirection>urn:ogc:def:axisDirection:OGC:1.0:rowPositive</axisDi
rection>
</CoordinateSystemAxis>

```

9.6 Column coordinate axis

The URN “urn:ogc:def:axis:OGC:0.0:Column” shall reference the definition of the column coordinate axis for a 2D square grid coordinate system. The definition of this column axis shall be the same as can be XML encoded using GML 3.1.1 as:

```

<?xml version="1.0" encoding="UTF-8"?>
<CoordinateSystemAxis xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/coordinateSystems.xsd" gml:id="Column"
  gml: uom="urn:ogc:def:uom:OGC:1.0:GridSpacing">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28 -->
  <name>Grid column axis</name>
  <axisID>
    <name codeSpace="urn:ogc:def:axis:OGC:1.0:>Column</name>
  </axisID>
  <axisID>
    <name codeSpace="urn:ogc:def:axis:OGC:1.0:>Sample</name>
  </axisID>
  <remarks>For this second grid axis, column coordinate values match
grid column numbers, but allow fractional coordinate values between
grid points. The first column is sometimes called the "left" column, so
the direction of this axis is "right", but these terms are not
required. </remarks>
  <axisAbbrev>C</axisAbbrev>
  <axisDirection>urn:ogc:def:axisDirection:OGC:1.0:columnPositive</axi
sDirection>
</CoordinateSystemAxis>

```

9.7 Image datum at pixel center

The URN “urn:ogc:def:datum:OGC:0.0:ImageDatumPixelCenter” shall reference the definition of an image datum with the origin at the centre of the first pixel. The definition of this image datum shall be the same as can be XML encoded using GML 3.1.1 as:

```

<?xml version="1.0" encoding="UTF-8"?>
<ImageDatum xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/datums.xsd" gml:id="ImageDatumPixelCenter">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <datumName>Origin at center of first pixel</datumName>
  <datumID>
    <name
      codeSpace="urn:ogc:def:datum:OGC:1.0:">ImageDatumPixelCenter</name>
    </datumID>
    <remarks>2D image datum with the origin at the center of the first
      pixel in the image file, usually the first pixel collected by the image
      sensor. In an image file, the pixels in the first row are assumed to be
      listed first, followed by other rows, with pixels in each row listed
      (and collected) in column number order. </remarks>
    <anchorPoint>center of first pixel</anchorPoint>
    <pixelInCell
      codeSpace="urn:ogc:def:pixelInCell:OGC:1.0:">cellCenter</pixelInCell>
  </ImageDatum>

```

9.8 Image datum at pixel corner

The URN “urn:ogc:def:datum:OGC:0.0:ImageDatumPixelCorner” shall reference the definition of an image datum with the origin at the outside corner of the first pixel. The definition of this image datum shall be the same as can be XML encoded using GML 3.1.1 as:

```

<?xml version="1.0" encoding="UTF-8"?>
<ImageDatum xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/datums.xsd" gml:id="mageDatumPixelCorner">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <datumName>Origin at outside corner of first pixel</datumName>
  <datumID>
    <name
      codeSpace="urn:ogc:def:datum:OGC:1.0:">ImageDatumPixelCorner</name>
    </datumID>
    <remarks>2D image datum with the origin at the outside corner of the
      first pixel in the image file, usually the first pixel collected by the
      image sensor. In an image file, the pixels in the first row are assumed
      to be listed first, followed by other rows, with pixels in each row
      listed (and collected) in column number order. </remarks>
    <anchorPoint>outside corner of first pixel</anchorPoint>
    <pixelInCell
      codeSpace="urn:ogc:def:pixelInCell:OGC:1.0:">cellCorner</pixelInCell>
  </ImageDatum>

```

9.9 Grid spacing unit of measure

The URN “urn:ogc:def:uom:OGC:0.0:GridSpacing” shall reference the definition of the grid spacing unit of measure (uom). The definition of this unit shall be the same as can be XML encoded using GML 3.1.1 as:

```
<?xml version="1.0" encoding="UTF-8"?>
<BaseUnit xmlns="http://www.opengis.net/gml"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.opengis.net/gml
    ../gml/3.1.1/base/datums.xsd" gml:id="GridSpacing">
  <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
  <name>Spacing between adjacent grid points, or between centers of
  adjacent pixels</name>
  <name codeSpace="urn:ogc:def:uom:OGC:1.0:">GridSpacing</name>
  <quantityType>Length</quantityType>
  <unitsSystem xlink:href="urn:ogc:def:uom:OGC:1.0:GridSpacing" />
</BaseUnit>
```

10 Supporting information

This clause introduces information provided in the annexes supporting the encoding described in Clauses 6 and 7:

- Annex A (informative) provides example application schemas based on these XML Schemas, with corresponding example XML documents and UML models.
- Annex B (informative) describes some unrectified image operation methods.

Annex A (informative)

Application schema examples

A.1 Introduction

This annex provides two Application Schemas based on the CRS Schemas that are applicable to images. Each of these example Application Schemas includes a corresponding example XML document using that Application Schema plus the example UML model from which that Application Schemas was converted. For more information on Application Schemas, see Subclauses B.3 and B.4 of “Recommended XML encoding of common CRS definitions” [OGC 05-011].

These XML examples use URNs to reference known objects using "xlink:href" and "gml:uom" XML attributes, based on documents [OGC 05-010] and [OGC 05-011].

A.2 Extended operation parameter definition

A.2.1 Introduction

This subclause provides an example of encoding additional information for Operation Parameters. The following subclauses contain:

- a) A draft class diagram of a UML package for an Extended Operation Parameter, which builds on the UML model in OGC Abstract Specification Topic 2.
- b) A draft XML Schema for encoding an Extended Operation Parameter, produced by converting this UML package.
- c) A XML encoding of the possible contents of the <<CodeList>> stereotyped ParameterType class in this UML package.
- d) An example XML document based on this draft XML Schema for encoding an Extended Operation Parameter

A.2.2 UML package

Figure A.1 is a class diagram of an example UML package for an Extended Operation Method. This UML package builds on the UML model in OGC Abstract Specification Topic 2.

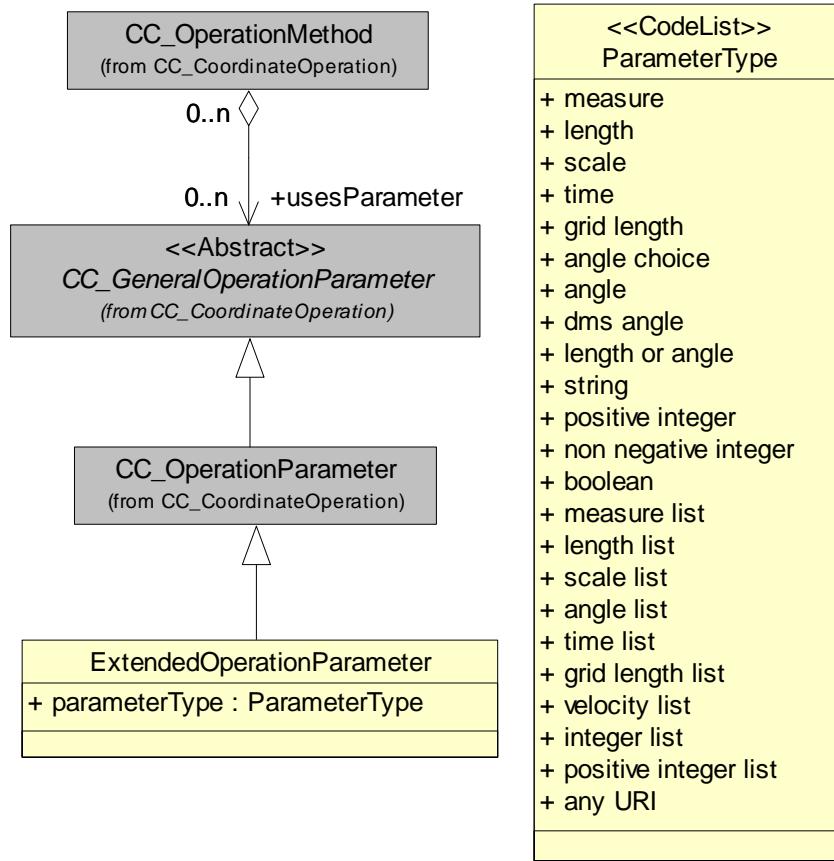

Figure A.1 — UML package for Extended Operation Method

A.2.3 Application schema

This subclause contains an example XML Schema for encoding an Extended Operation Parameter, produced by converting the above UML package. This XML Schema builds on the coordinateOperations.xsd XML Schema. This draft XML Schema is written following the same GML 3 patterns and ISO 19118 XML encoding rules as used in the CRS Schemas in GML 3.1.1. As required, this draft XML Schema is written as an Application Schema in a different namespace.

This example XML Schema is:

```

<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns:ex="http://www.opengis.net/examples"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.opengis.net/examples"
  elementFormDefault="qualified" xml:lang="en">
  <annotation>
    <documentation>
      <name>extendedOperationParameter.xsd</name>
      <scope>How to encode extended information for operation
parameters. </scope>
    </documentation>
  </annotation>

```

```

        <description>Example Application Schema to encode extended
information for operation parameters. Builds on
coordinateOperations.xsd, and follows same GML 3 patterns and ISO 19118
encoding. Written in the "ex" namespace. Primary editor: Arliss
Whiteside. Last updated 2005-01-28</description>

```

NOTE Subclause D.2.4 of document [OGC 05-011] provides a corresponding example XML document not using this Application Schema.

A.3 Universal image geometry model transformation

A.3.1 Introduction

Standardized XML encoding is needed for a number of frequently-used types of image coordinate transformations. This subclause provides an example of one such encoding, applied to an example image coordinate transformation. That example type of image coordinate transformation is the one described in Section 6.5 of OGC Abstract Specification old Topic 7: The Earth Imagery Case [OGC 99-107], namely the Universal Image Geometry Model (UIGM). That UIGM transformation is from a 3D ground coordinate reference system to a 2D image coordinate reference system, and has been simplified here for brevity. The following subclauses contain:

- a) A draft class diagram of a UML package for this simplified UIGM transformation, which builds on the UML model in OGC Abstract Specification Topic 2.
- b) Two draft XML Schemas for encoding this simplified UIGM transformation, produced by converting this UML package.
- c) An example XML document based on this draft XML Schema for encoding an example UIGM transformation, plus an example XML document based on the Application Schema in Subclause A.2.3 for encoding the Operation Method used by this UIGM transformation.

A.3.2 UML package

Figures A.3 to A.7 contain the five parts of a draft class diagram of a UML package for this simplified UIGM transformation. Figure A.3 shows the top level of the class diagram, without showing the components of the SectionParametersGroup and MonoscopicErrorsGroup. This diagram is incomplete in that some of the needed association role names and multiplicities are not shown due to lack of space. Figure A.3 shows the top level within the SectionParametersGroup, without showing the components of the NormalizationParametersGroup and PolynomialGroup. Figure A.5 shows one example parameter value in the NormalizationParametersGroup, with a note listing the other nine parameter values. Figure A.6 shows two example parameter values in the PolynomialGroup, with a note listing the six other parameter values. Figure A.7 shows the complete contents of the MonoscopicErrorsGroup.

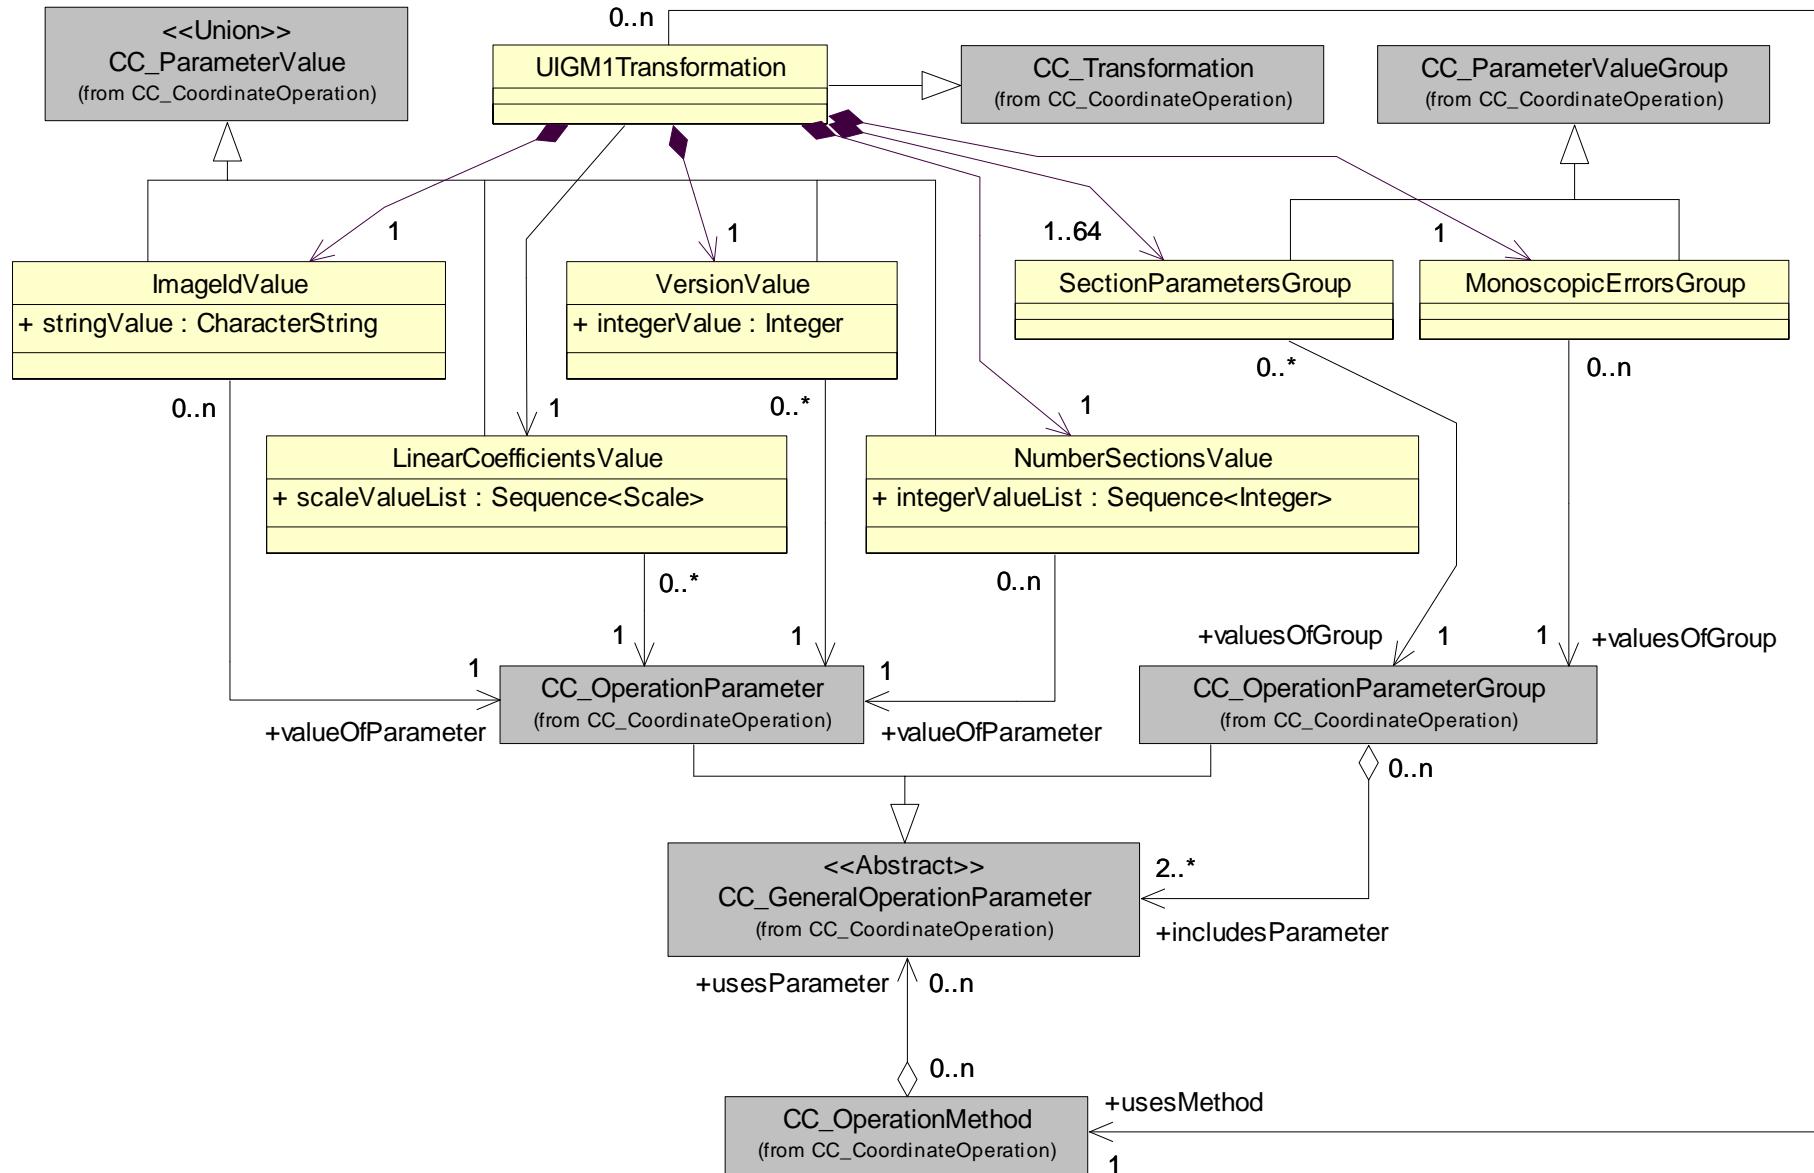

Figure A.3 — UML package for UIGM transformation, page 1

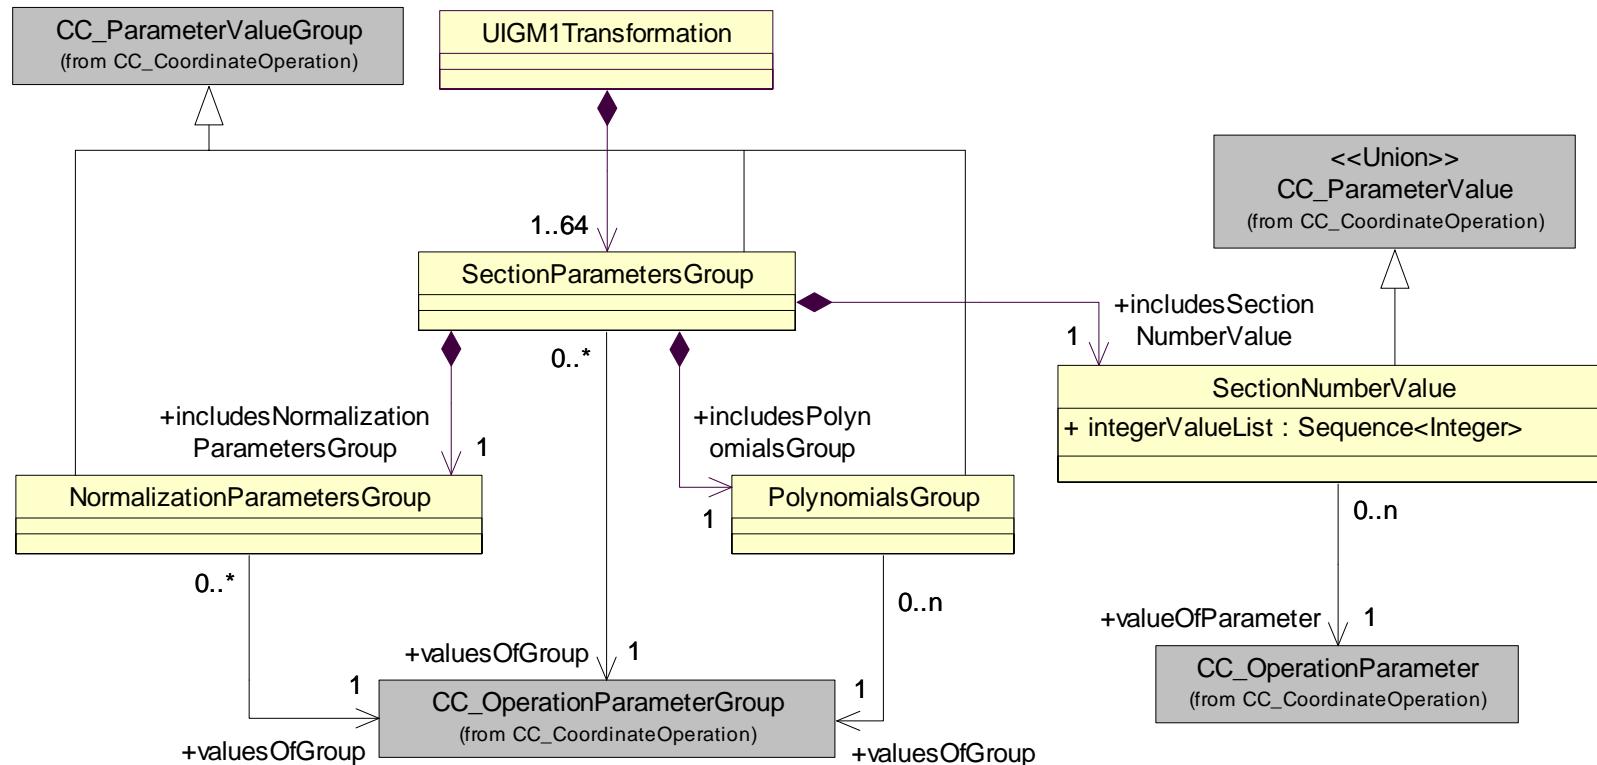

Figure A.3 — UML package for UIGM transformation, page 2

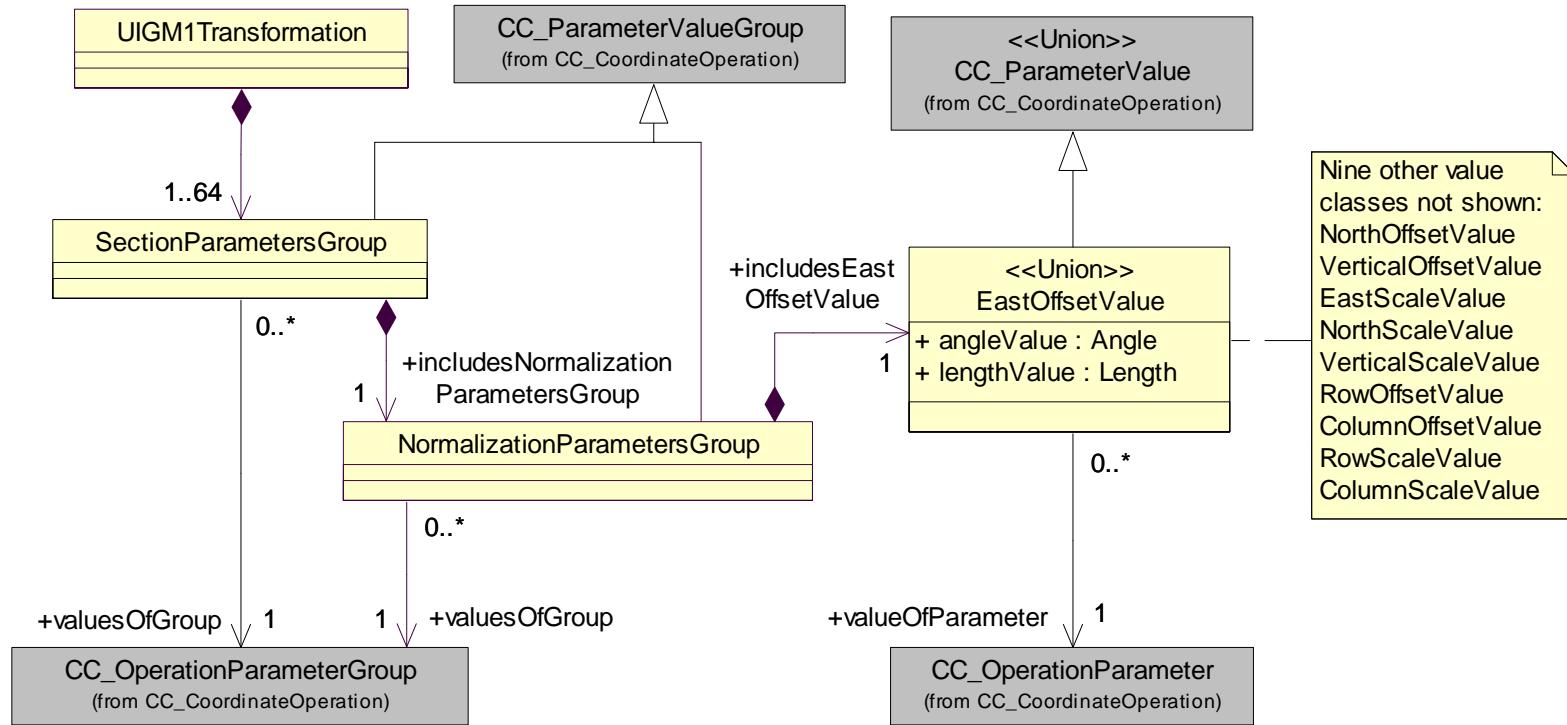

Figure A.5 — UML package for UIM1 transformation, page 3

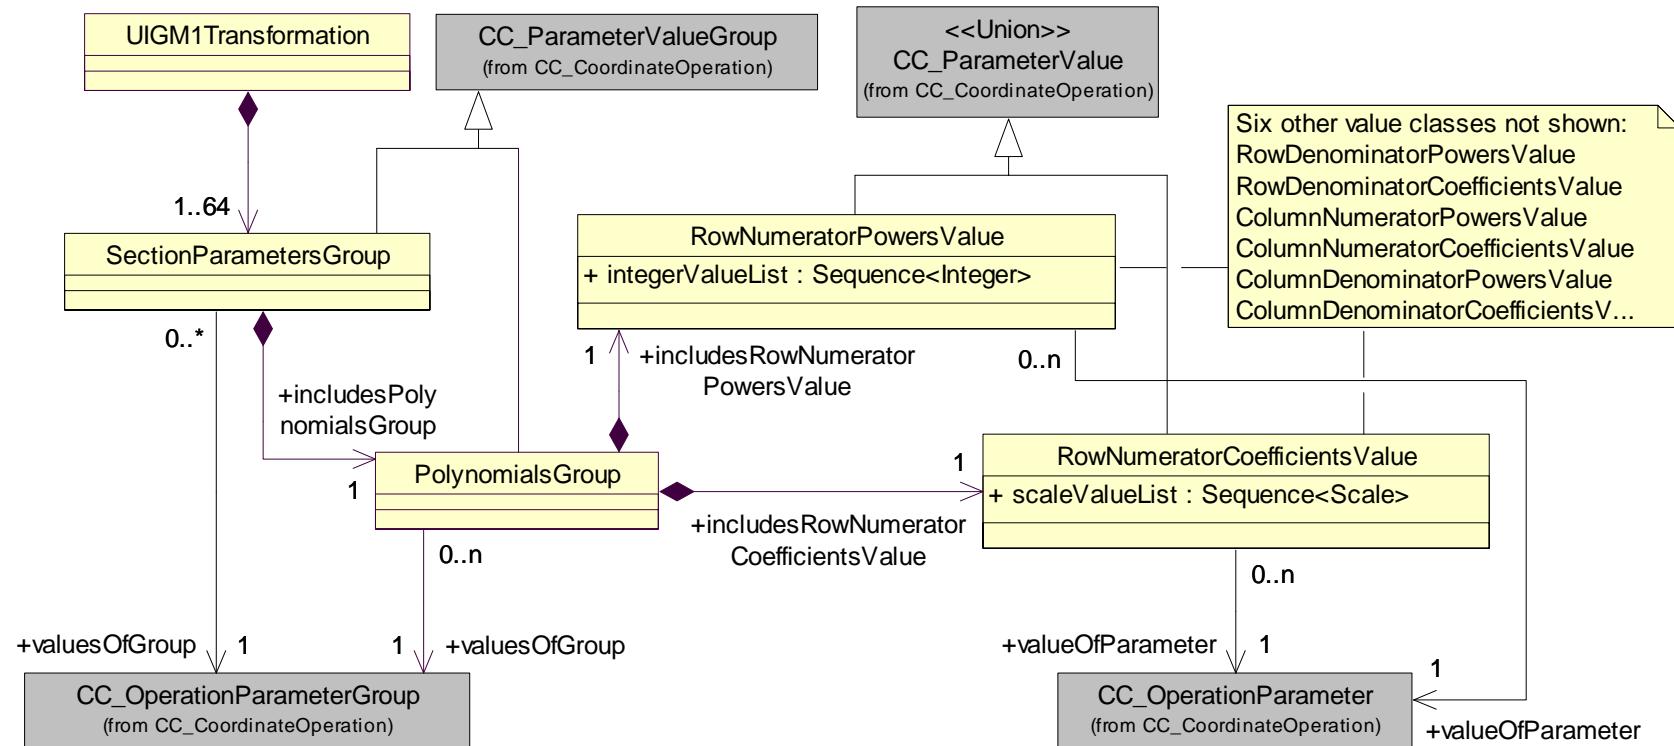

Figure A.6 — UML package for UIGM transformation, page 4

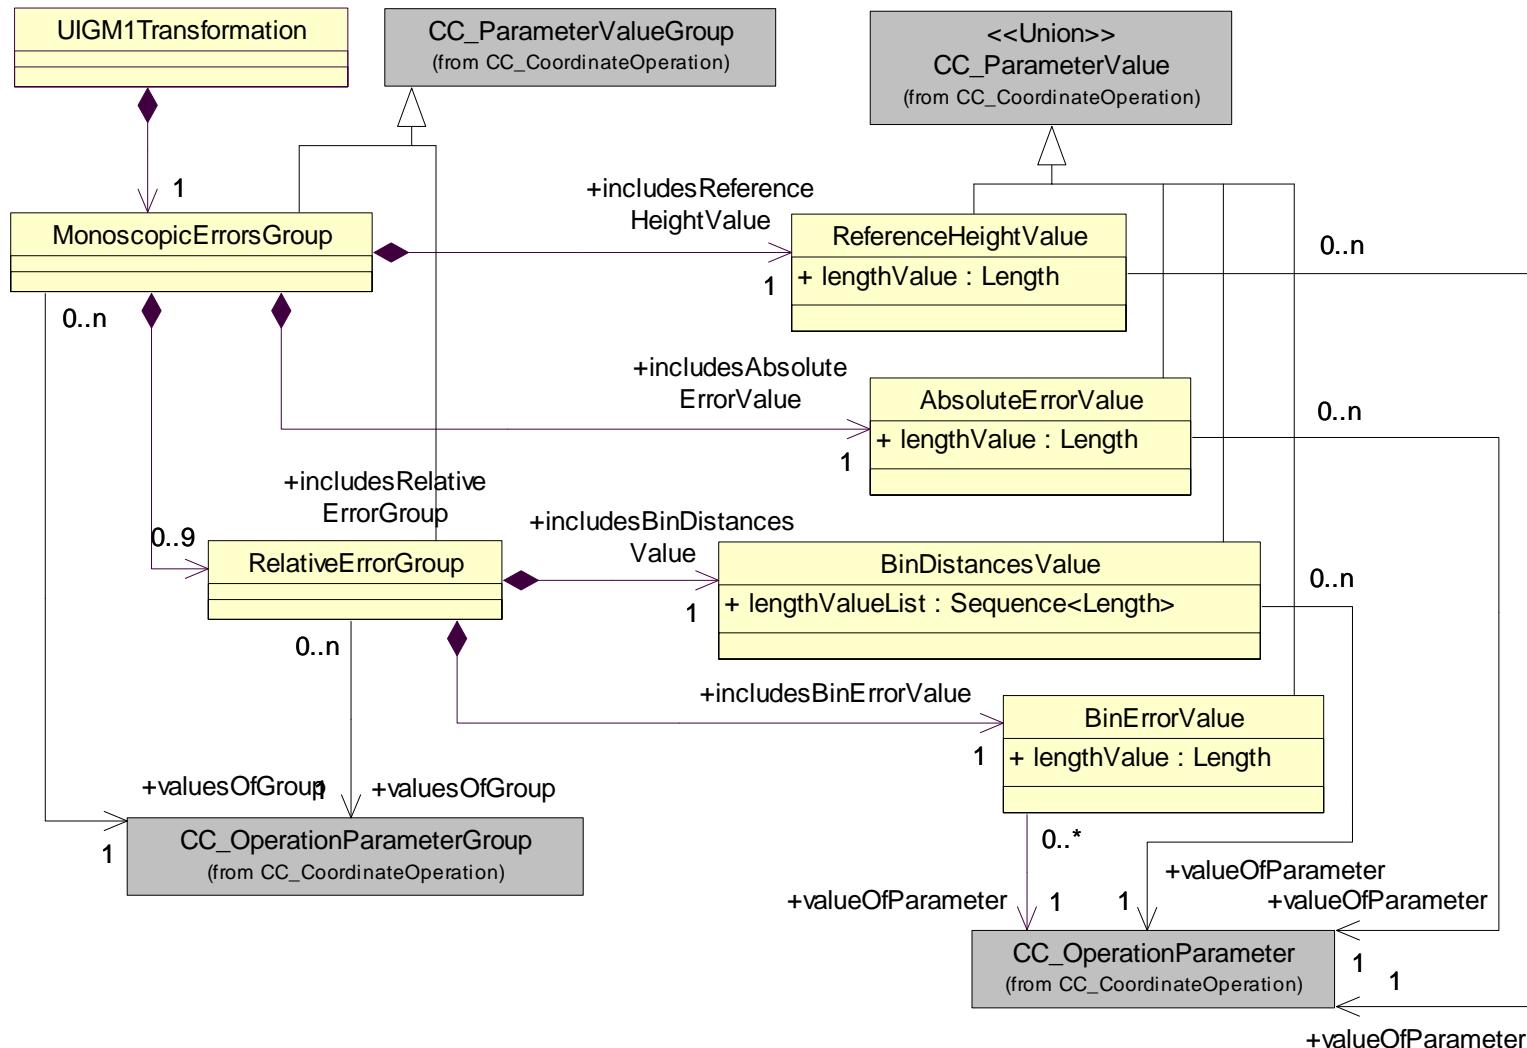

Figure A.7 — UML package for UIM transformation, page 5

A.3.3 Application schemas

This subclause contains example XML Schemas for encoding this simplified UIGM transformation, produced by converting the above UML package. These XML Schemas build on coordinateOperations.xsd. These draft XML Schemas are written following the same GML 3 patterns and ISO 19118 XML encoding rules as used in the CRS Schemas in GML 3.1.1.

The first draft Application Schema is:

```

<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema"
  xmlns:gml="http://www.opengis.net/gml"
  xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:ex="http://www.opengis.net/examples"
  targetNamespace="http://www.opengis.net/examples"
  elementFormDefault="qualified" xml:lang="en">
  <annotation>
    <documentation>
      <name>UIGM1transformation.xsd</name>
      <scope>How to encode definition of Universal Image Geometry
Model for one image. </scope>
      <description>Example Application Schema to encode ground-to-
image coordinate transformation data for a specific image, using the
Universal Image Geometry Model type of coordinate transformation as
described in Section 6.5 of OGC Abstract Specification Topic 7 : The
Earth Imagery Case (OGC document 99-107). This example does not encode
data for the image correction tables, stereoscopic position error
estimates, and most information not used by the image geometry model.
Builds on coordinateOperations.xsd and typedValues.xsd, and follows
same GML 3 patterns and ISO 19118 encoding. Written in the "ex"
namespace. Primary editor: Arliss Whiteside. Last updated 2005-01-
28</description>
      <copyright>Copyright (c) Open Geospatial consortium (2005)
    </copyright>
      <conformance>This schema encodes a draft UIGM package that
builds on the Coordinate Operation (CC_) package of the extended UML
Model for OGC Abstract Specification Topic 2: Spatial Referencing by
Coordinates. That draft package defines restricted subtypes of the
CC_Transformation, CC_ParameterValue, and CC_ParameterValueGroup
classes as needed for the UIGM transformation. </conformance>

</schema>
```

The above example Application Schema is shortened by building on a separate example Application Schema. This other Application Schema defines XML Schema complexTypes for a number of types of operation parameter values. The complexTypes defined include 8 parameter types used in the Application Schema above, plus 8 TBD more types expected to be useful in other image geometry model transformations. This second draft XML Application Schema is:

```

<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema"
xmlns:gml="http://www.opengis.net/gml"
xmlns:xlink="http://www.w3.org/1999/xlink"
xmlns:ex="http://www.opengis.net/examples"
targetNamespace="http://www.opengis.net/examples"
elementFormDefault="qualified" xml:lang="en">
  <annotation>
    <documentation>
      <name>typedValues.xsd</name>
```

```

        <scope>How to encode operation parameter values with specific
types, including length, angle, and scale measures.. </scope>
        <description>Example Application Schema to encode operation
parameter values with specific types. Builds on measures.xsd, and
follows same GML 3 patterns. Written in the "ex" namespace. Primary

</UIGM1Transformation>
```

The above XML example uses dummy values such as "Aaaa" in place of real values for some text string values. Similarly, this example also uses dummy values such as "99.99" in place of real values for some numerical values. This example assumes that the Application Schemas specified in Subclause A.3.3 are accessible using the location UIGM1transformation.xsd.

The above XML example also assumes that (complete) information for several items is available elsewhere. The definition of the sourceCRS and targetCRS are assumed to be available elsewhere, and can be encoded in XML as shown in the example XML in Clause 7 of this document and in Subclauses 6.2.2, 6.3.2, and 6.6.2 of “Recommended XML encoding of common CRS definitions” [OGC 05-011].

The definition of the simplified UIGH OperationMethod can be XML encoded using the example Application Schema from Subclause A.2.3, and could be:

```

<?xml version="1.0" encoding="UTF-8"?>

    <!-- Primary editor: Arliss Whiteside. Last updated 2005-01-28-->
    <methodName>Universal Image Geometry Model Transformation
(simplified)</methodName>
```

<remarks>This operation method implements the universal image geometry model that transforms ground coordinates into georeferenced image coordinates. This image geometry model uses one ratio of two polynomial functions to compute the row image coordinate, and uses a similar ratio of two different polynomials to compute the column image coordinate. All four polynomials are functions of three ground coordinates: two horizontal coordinates and one vertical coordinate. In the polynomial functions, the three ground coordinates and two image coordinates are each offset and scaled to have a range from -1.0 to +1.0 over an image or image section. For brevity, this simplified operation method specification does not include all geometry model parameters or all optional XML elements. </remarks>

<methodFormula>See Section 6.5 of document OGC 04-071.

Annex B (informative)

Image coordinate operation methods

B.1 Introduction

This annex discusses the following non-exhaustive list of coordinate transformation types applicable to image coordinate reference systems:

- a) Ground-to-image transformations
- b) Elevation coverage for 2D to 3D coordinate transformations
- c) Single-image-to-ground transformations
- d) Elevation coverage with single-image-to-ground transformations

B.2 Ground-to-image transformations

This set of operation methods defines transformations used for ground-to-image coordinate transformations, with one method used for each image geometry model type. The input to such a transformation is usually 3D ground coordinates, and the output is usually 2D image coordinates. These methods will usually use operation parameters for directly transforming 3D ground coordinates to 2D image coordinates.

B.3 Elevation coverage for 2D to 3D coordinate transformation

This operation method defines a transformation using an elevation coverage for 2D to 3D coordinate transformations. One operation method can be used for each elevation coverage format, with one operation parameter that references the elevation coverage data. The input to this transformation is 2D horizontal coordinates (plus the separately specified elevation coverage), and the output is 3D coordinates. This transformation can be used in a Concatenated Operation with a ground-to-image transformation, to go from 2D ground coordinates to 2D image coordinates.

B.4 Single-image-to-ground transformations

This set of operation methods defines transformations used for single (or monoscopic) image-to-ground transformations, with one operation method used for each image geometry model type. These methods could use parameters for directly transforming 2D image coordinates to multiple 3D ground coordinates. Alternately, these transformations could use parameters for directly transforming 3D ground coordinates to 2D image coordinates (like ground-to-image transformations).

The output from such a transformation is usually 3D ground coordinates, and the input can be 2D image plus 3D ground coordinates. In that case, the 3D ground coordinates are

used to provide a fixed elevation value, to be used with the 2D image input coordinates. The horizontal position is included with each elevation to facilitate ground coordinate transformations. Inclusion of the horizontal position also allows the client to provide an approximate horizontal ground position, when known. Server software implementing such transformations is allowed to make use of this approximate horizontal position, to speed computation.

B.5 Elevation coverage with single-image-to-ground transformation

This operation method defines a transformation using an elevation coverage with a single-image-to-ground transformation. One operation method can be used for each elevation coverage format, with one operation parameter that references the elevation coverage data. This assumes that interface implementations will first use a separate single-image-to-ground transformation to compute two or more points along the image ray. The implementation will then intersect this ray with the ground shape defined by the elevation coverage.

The output from this transformation is usually 3D ground coordinates, and the input can be 2D image plus 3D ground coordinates (plus the separately specified elevation coverage). In that case, the input 3D ground coordinates are used to provide an approximate elevation value, to be used with the 2D image input coordinates. The horizontal position is included with each elevation to facilitate ground coordinate transformations. Inclusion of the horizontal position also allows the client to provide an approximate horizontal ground position, when known. Server software implementing such transformations is allowed to make use of this approximate horizontal position, to speed computation.
