Title: 	*Make clear the distinction between a Process Description, a WPS Application Profile, a profile of the WPS Specification
Source: 	*Edward Nash, Rostock University
Work item code: 	
Category: 	* D (Editorial modification)
Reason for change: 	* Currently the distinction between a WPS Process Description, a WPS Application Profile and a profile of the WPS spec. is not made sufficiently clear: section 6.4 "WPS Profiles" starts by talking about "standardized profiles" and then moves into "Application Profiles".

Summary of change: 	* The following distinctions need to be made clear: 1. A WPS Profile is a specialisation of the WPS interface, e.g. making optional operations or parameters mandatory (or removing them altogether). 2. A WPS Application Profile is (in the WPS1.0 form) a standardised ProcessDescription which may be found through a registry using its assigned URN. 3. A ProcessDescription is (again, in the WPS1.0 form) a description of a process and its inputs/outputs. It may also indicate that it implements a particular WPS Application Profile. It may be a good idea to choose a different term to "Application Profile", e.g. GML has "Application Schema", in order to make misunderstandings less likely.
Consequences if not approved: 	Confusion as to what a "WPS Profile" and a "WPS Application Profile"
Clauses affected: 	* Mainly 6.4 "WPS Profiles", probably also others.
