<b>Title:</b> ⓘ	*Extend basic package to describe actual OGC artifacts.
<b>Source:</b> ⓘ	*???
<b>Work item code:</b> ⓘ	
<b>Category:</b> ⓘ	* B (Addition of feature)
<hr/>	

**Reason for change:** ⓘ

\*

The basic package currently describe a very small subset of OGC artifacts and is missing what I believe most people would consider basic object types. For example there are no object type identifiers to distinguish between a wms layer and a wfs featute type. This makes the csw fairly useless without additional extension packages. I believe that an ogc catalogue should be able to harvest ogc artifacts right out of the box without additional packages.

**Summary of change:** ⓘ

\*

- 1) Figure out from the set of OGC artifacts which might need to be catalogued. Surely a wms layer is a basic ogc artifact that we would want to be catalogued.
- 2) Figure out what associations and classifications exist for and among the set of objects identified in (1).
- 3) Revise the basic package accordingly.

**Consequences if not approved:** ⓘ

- 1) Right out of the box a current CSW-ebRIM catalogue is not very useful at registering and cataloging OGC objects.
- 2) OGC catalogues will be even less interoperable than they are now if each implementation uses its own object/association/classification identifiers. This is even a problem if two extension packages define different identifiers for the same object types ... for example.
